ABSTRACT

The alternative methods of displaying geophysical data from the NERC computer are illustrated together with a summary of the various data acquisition systems in use.

1. AQUISITION OF GEOPHYSICAL DATA AT SFA

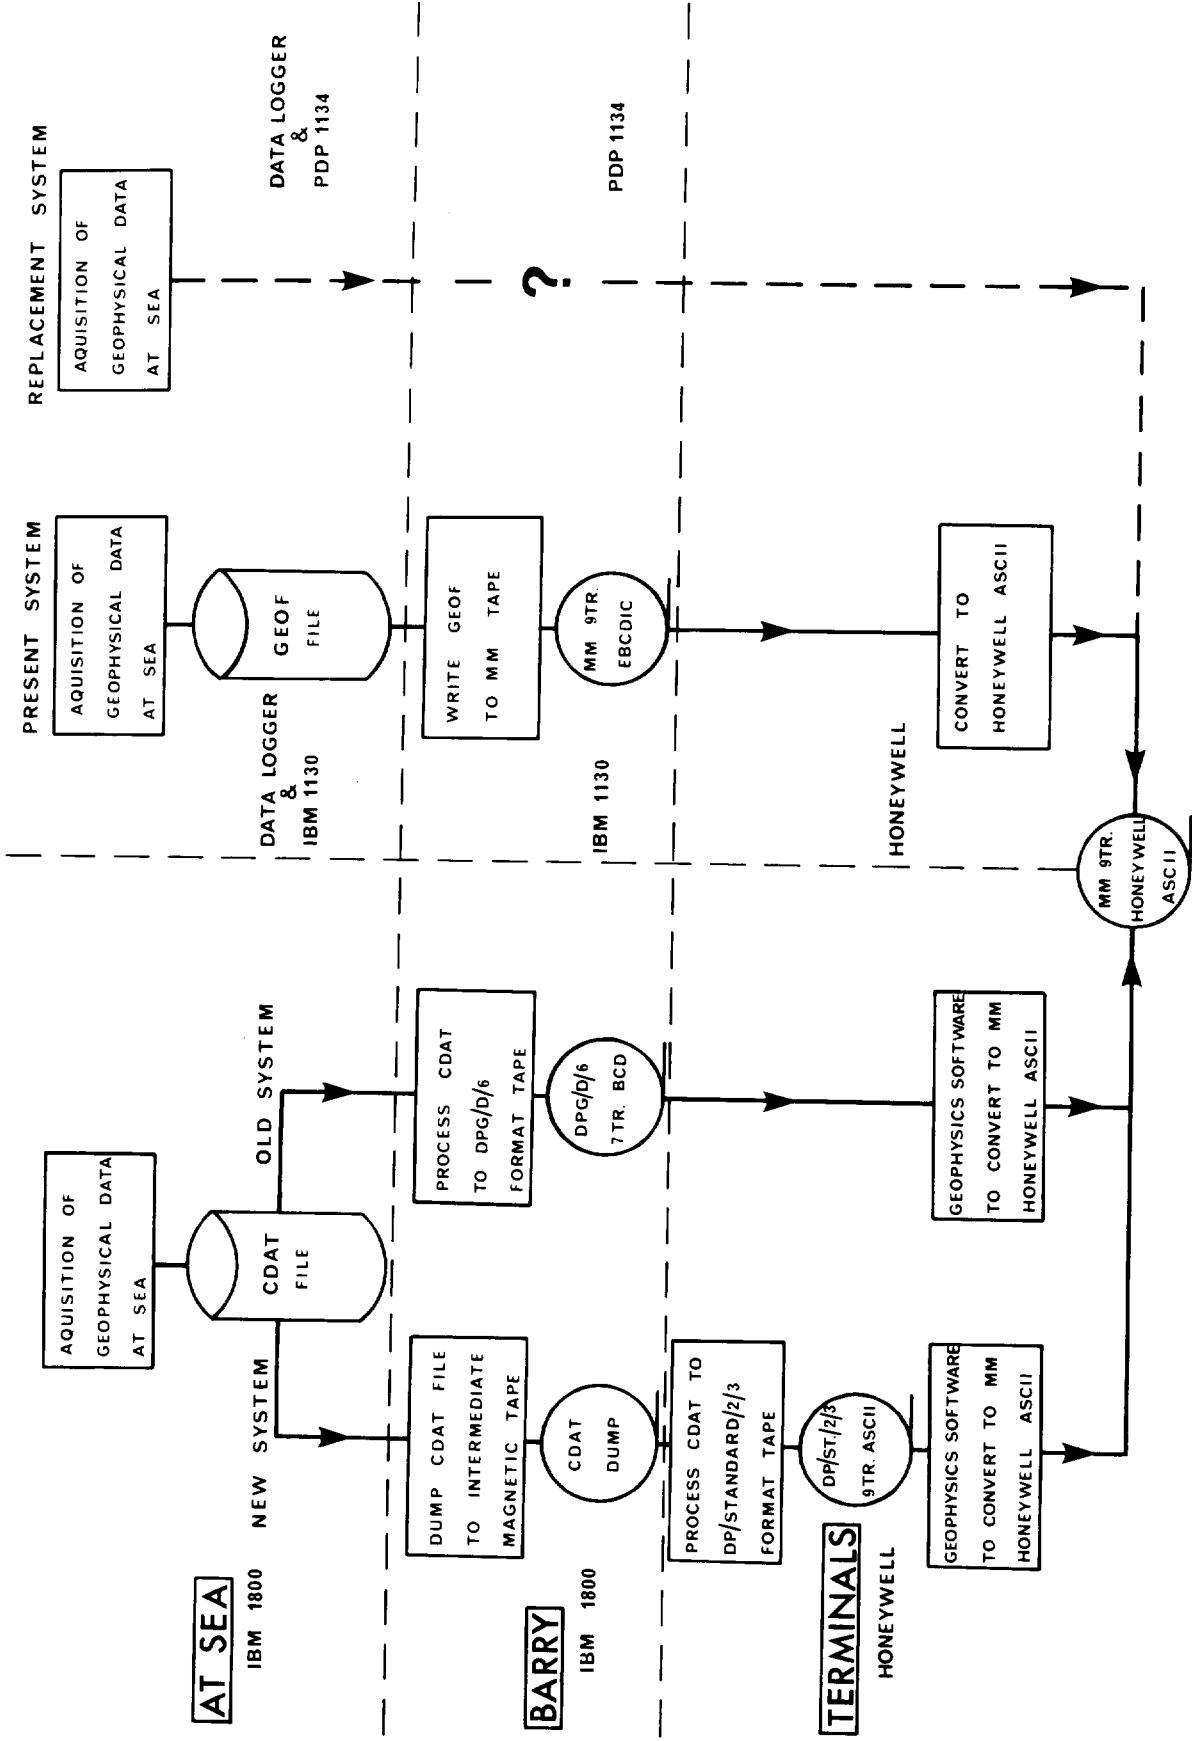

(a) DISCOVERY IBM 1800 SYSTEM

The IBM 1800 computer system installed onboard R.R.S Discovery samples the various data inputs and then manipulates the data to produce values at two minute intervals.

The relative values for ships speed, wind velocity and direction are calculated and written to the CDAT file together with the ships dead reckoning and observed data inputs. Positional information is monitored from navigational satellite passes, decoded and verified. If the satellite fixes are acceptable the dead reckoning values are updated, the observed data are processed to reduce the total magnetic and gravity readings to anomaly values by removing the respective reference fields. The ships course and speed and wind velocity are updated. Manually entered depths which are held in an input file are corrected for matthews area and written to the CDAT file together with the other corrected data.

Manual editing of the CDAT data involves the generation of plots, lists and profiles, using the MPX operating system, to systematically analyse and correct any errors. This is performed on a daily basis (Strudwick, 1976).

At the completion of a cruise all the corrected underway data is contained on CDAT disc files which are subsequently held at Barry.

CONVERSION OF CDAT FILE TO MM TAPF FILE

(i) OLD SYSTEM

The CDAT disc files are processed at Barry on the land based IBM 1800 computer to produce a file on magnetic tape, one per cruise leg, of CDAT data in DPG/D/6 format. This tape is 7 track BCD 556 bpi. The magnetic tape is transferred to the Honeywell computer system at Bidston, where it can be accessed from terminals. Using Geophysics software the CDAT tape is processed to produce geophysical data on a 9 track Honeywell ASCII coded magnetic tape in merged merged international data exchange format.

(ii) NEW SYSTEM

The CDAT disc files are dumped without processing on to an 'intermediate' magnetic tape, one tape per cruise leg, using the IBM 1800 computer at Barry.

The tapes are transferred to the Honeywell computer system at Bidston where they can be accessed from terminals.

The tapes are processed using NCS developed software to produce a file in DP/STANDARD/2 version 3 format which is stored on 9 track 1600 bpi magnetic tape in non Honeywell ASCII coding. The format is designed so that it is suitable for any computer system handling formatted tape files.

The new tape is then, using Geophysics software, processed to produce geophysical data in merged merged international format on 9 track 800 bpi Honeywell ASCII coded magnetic tape.

Development is in progress to enable the production of the 'intermediate' tape to be carried out on the shipboard computer during the cruise.

(b) DATA LOGGER AND IBM 1130 PORTABLE COMPUTER SYSTEM

Cruise data is sampled and stored on magnetic tape by the data logger at one second intervals. Each logger tape lasts approximately fourteen hours then it can be removed to the 1130 system and data transferred to working files GEO..

Observed total magnetic and gravity readings are reduced to anomaly values by subtracting the reference field data.

The ships dead reckoning navigation is updated by manually entered satellite navigation fixes and written to GEOF. Depths, also entered manually, are corrected for matthews area by the input program and stored in GEOF together with navigation and anomaly values.

Editing of the GEOF data involves displaying profiles, lists and charts to identify and remove errors. Each GEOF disc file holds approximately five days data recorded at two minute intervals.

The GEOF files are written to 9 track EBCD coded magnetic tape in two forms; as a straight dump or converted into merged merged format.

On completion of the cruise the tapes are transferred directly to the Honeywell computer system at Bidston where the are accessible from terminals. The merged merged tape is converted and written to a 9 track Honeywell ASCII coded magnetic tape in the same merged merged international data exchange format as the tapes from the IBM 1800 system.

(c) PDP 1134 REPLACEMENT COMPUTER SYSTEM

As of writing, a PDP 1134 has been delivered to the Shipboard Computer Group at RVS Barry and is under software development tests. This system will replace the IBM 1130.

Details of data handling and software were not available at time of writing but the data will be output as a magnetic tape in merged merged to be accessed through terminals of the Honeywell system.

2. DISPLAY OF GEOPHYSICAL DATA

Geophysical data is stored on 9 track tapes in merged merged international format coded in Honeywell ASCII. Tapes are accessed via terminals of the Honeywell system. The basic requirements for display of data is in the form of listings, profiles and chart plots.

DATA DISPLAY

PROGRAMS

LISTINGS	Direct merged merged listings of tape.	LISDAT
	6 minute sampled listing in Data Report format.	
PROFILES	Profiles of all underway data fields plotted against distance run.	PROFPLOT
	Single profile of underway data field plotted against run.	
CHART PLOTS	Ships track. Data profile along track. Annotated data along track. Simplified track for whole cruise.	GEOPLOT

(a) LISTINGS

LISDAT provides programs to list geophysical data from a merged merged tape as either a direct continuous listing in mm format of 2 minute data or as a 6 minute sampled listing in Data Report format split into pages.

(b) PROFILES

PROFPLOT contains a set of programs to produce profiles of underway data plotted against distance run along track, which can be located on a mercator track chart of the same scale. Profiles can be plotted either individually or as multiple fields above each other on an A4 size page for presentation.

(c) CHART PLOTS

GEOPLOT contains a set of programs to read from a mm tape and plot the data at specified scale and map projection. The plotting routines are for ships track, ships track annotated with hour marks and satellite positions, data field values printed along the track and profiles of data along the track.

To plot the ships track for a whole cruise it is necessary to reduce the amount of data points to significant course changes, this is provided by program NAVSEL.

(d) EXAMPLES

The data used in these examples comes from Discovery Cruise 84 leg 1
Reykjanes ridge survey.

1. Merged merged data list.
2. Data Report list.
3. Profile of magnetic anomaly. Scale 1:2000000 at 57 degrees north.
Mercator projection.
4. Multiple profiles of underway data. Scale 1:2000000 at 57 degrees
north. Mercator projection.
5. Ships track with time marks and satellite fixes. Scale 1:2000000 at
57 degrees north. Mercator projection.
6. Magnetic anomaly values printed along track. Scale 1:2000000 at 57
degrees north. Mercator projection.
7. Magnetic anomaly profile along track. Scale 1:2000000 at 57 degrees
north. Mercator projection.
8. Ships track from whole tape. Day number annotated at midnight. Scale
1:13000000 at 57 degrees north. Mercator projection.

3. GEOPHYSICAL DATA REPORTS

These reports document navigation, magnetic, bathymetric and gravity data collected during I.O.S cruises. The profiles, tables and track charts are all generated from merged merged data tapes using the routines previously mentioned.

PROFILE LOCATION SHEET

The ships track is plotted on an outline bathymetric chart at a scale of 1:2400000, this is used for locating data profiles. The day numbers are annotated at midnight positions. The profile positions are numbered.

DATA PROFILES

Profiles of magnetic anomaly, corrected depth, free air anomaly, course-made-good and speed-made-good are plotted against distance run along the ships track from the start of a leg. The distance is scaled to 1:240000 and adjusted for mercator projection enabling the profiles to be overlain on the location sheet. A time axis in GMT is included to enable correlation with data listings, which are recorded against time not distance.

Reduced copies of the original P.E.S./S.R.P. records are mounted opposite the appropriate profile to provide more detail.

NAVIGATION

Navigation track charts are plotted at a scale of 1:1000000 at the standard latitude in 4 degree areas. Hour marks are annotated with hour and day number every six hours. The position of acceptable satellite fixes are annotated with time.

DATA LISTINGS

Data from the mm tape is listed at 6 minute intervals in report format with additional Julian day numbers.
