Purposeful partnerships and practices: an international education collaboration in global health

Executive summary

Students studying in UK universities can expect an international and cosmopolitan education, learning with and from people of all nationalities, gaining new perspectives and beginning to see themselves as citizens of the world. International travel and periods of relocation are already part of higher education for some, yet data indicates that certain groups rarely study abroad. Despite past trends, health students’ use of Erasmus exchanges has been found to be decreasing in recent years. While the complex interplay between personal, academic and career issues means each student’s decision is unique, learning from successful approaches to broader forms of participation is important given how much is known about the personal benefits and mutual rewards of exchange programmes.

A collaborative project between Southampton and Lund Universities offers an alternative to the traditional individual exchange programme, providing short, intensive ‘visits’ to each other’s countries involving all final year students. This report offers findings from HEA-funded research into the collaboration, carried out with student researchers and based on a participative, co-researcher methodology. Six pedagogic approaches that promote partnership working are discussed and incorporated into a ‘circles of partnership’ exercise for those interested in developing collaborative exchange schemes.

Background to research

To make an international education a reality for occupational therapy students, who spend considerable periods of time in local health and care organisations learning through practice, an existing research relationship with Lund University was explored for its educational potential. Now entering its fourth year, the collaborative model is based on short intensive visits for all final year students studying occupational therapy at Lund and Southampton universities. Funding has been variously sourced, and sustainability remains a goal, making research timely and important. Competitive tendering was successful through the Higher Education Academy (HEA) ‘Students as partners’ strand of work, enabling a year-long investigation to take place.

Themes in literature

The development of a more globally orientated workforce has long been a goal of the World Health Organisation. Professionals with a pluralistic worldview and intercultural skill and competence are key to developing a global health workforce. Yet ways of incorporating this goal into nationally and regionally commissioned higher education programmes remain elusive: classroom strategies alone have been found to be problematic, while critics of ‘gap year’ or shorter volunteer schemes consider them to do more harm than good. Even well-organised exchange schemes have been found through research to affect only marginally students’ sense of intercultural capability. The broader demographic of students reflected in health programmes means inclusive, sustainable international education needs to be more widely available if new approaches, not dependent solely on individual travel and relocation, are to be offered. Little research exists into international collaborations from the perspectives of so-called ‘non-traditional’ students or by student researchers.

Methodology

The research question asked whether and how the international partnership influenced students’ knowledge, understanding and sense of identity as global healthcare citizens, and whether they considered intercultural capabilities to be developed through their professional education.

An interview-based study elicited rich qualitative data from which themes were developed. An online survey evaluation was developed from the refined interview schedule. Involvement by student co-researchers in all aspects of methodology characterised the research team’s work, including: study design, methods, interview schedule development, all stages of ethical approval gained from the Faculty of Health Sciences in November.
Four themes were developed that explored: the development of meaningful relationships between students; the development of a professional identity as part of a global community; expectations, trepidation and reflections on achievements; and beginning to speculate on how others experienced the world. Each theme served to complicate and enrich notions of students working in multiple partnerships and as members of communities, and to challenge concepts of students as self-interested agents or consumers. Interviewees’ detailed accounts offer insights into the way their knowledge deepened and confidence and understanding grew, while they started to look afresh at their profession, its global nature and the need to become agents of social change. Honesty and openness in interviews showed how social and personal learning took place and was, for some, transformative.

The pedagogic approaches that served to promote generosity and mutuality emerged in participants’ detailed descriptions and accounts. Findings introduced the potential of working on shared concerns, as a means to transcend local and national healthcare systems and to discover new allegiances and alternative futures.

Conclusions and implications

Six pedagogic approaches with established roots in education theory and research are compared with findings, each being in some way or other pivotal to the establishment and sustenance of partnership working. Each is presented and discussed in terms of their broader application, and an exercise we call ‘circles of partnership’ is suggested as part of developing a holistic approach to inter/national collaborative ventures.

1. Working on ‘real’ projects and shared concerns

Students described the short intensive visits as remarkable in their effectiveness in forging productive project work groups, able to carry out research, overcome language differences and present to peers after only five days. In working hard both practically and intellectually, learning by doing, and developing more reflexive approaches, they reflected the theoretical work of Beckett (2009) and Billett (2008).

2. Informal learning

The importance to participants of time spent simply ‘being’, whether together in mixed project groups, or as friendship groups, or travelling and socialising, the importance to them of informal time cannot be over estimated. We conclude that, as Usher (2010) and others have asserted, the potential of informal learning, not being assessed or overviewed, is undervalued in education more generally.

3. High expectations, high support

The stimulation of learning independently, with sometimes ambiguous or seemingly abstract briefs, was deeply rewarding. ‘High level’ support meant final year students were required to immerse in topics, and to be able to call upon ‘experts’ in informed and thoughtful ways. Balancing high expectations with high support – of the kind students find supportive – is developed from Kift, Nelson and Clarke’s (2010) research.

4. Communities of practice and circles of partnership

Participants spoke of ‘feeling’ part of a community that went beyond education and practice contacts, and of being involved in networks developed through social media. Many shared and contributed through forms of reportage, seeing their work circulated widely. The ‘joint enterprise’ of Wenger’s (1998) concept of communities of practice emerged in descriptions of relationships forged around common purposes, and led us to develop a ‘circles of partnership’ exercise to further involve students in international collaborations.

5. Embedding principles of care, hospitality and reciprocity in partnerships

Mann’s (2008) work provided a starting point for understanding the many kinds of inclusivity – and exclusivity – described by participants, and engendered by travel, visits, new relationships, and new ‘selves’. Ways to involve students unable to travel, or who choose not to do so for a variety of reasons, and the wider duties of institutions and technologists, are discussed.

6. Students as producers of high quality healthcare

Final year students showed themselves to be fully aware of their contribution to practice, to education and to a global healthcare community. New insights meant healthcare decisions were critiqued in societal and political terms rather than through the lenses of pragmatism, expediency and necessity. We suggest Neary’s (2013) concept of student as producer opens the door to much more explicit constructions of students as producers and as partners: with people using services, with practitioners and with their academic colleagues.

The report concludes with reflections on the potential for partnership working that is based on a questioning, critical and pluralist approach to education more generally, and which is recognisable within curricula and across the institutions of higher education.
Introduction

Students entering universities in the United Kingdom are promised an international, cosmopolitan education. Whatever their course of study, they can expect to learn with people from different parts of the world, to question and evaluate belief systems, to gain new perspectives and to begin to see themselves as citizens of the world, sharing concerns that transcend geographical boundaries. This report considers how such ideas can be ignited and explored in partnership with students, through the curriculum, and how they have the potential to influence and challenge the ‘culturally specific constructions’ of knowledge that come to define what is taught (Grant, 2013:12).

We present research into a collaborative project that has exploration at its heart, as students from two universities visit each other’s countries, share learning formally and informally, and explore the ideas and values underpinning their national health and care systems. It is redolent of the kind of student mobility that Riordon (Joint steering group on UK outward student mobility, 2012) regards as a ‘global mindset’, central to the development of a sense of oneself as a person in the world, that connects to global health allegiances and interests that go beyond narrow specialisms or national interests. The project that started with a conversation between academics was realised with and by students, and it is the students’ words that reflect higher education’s internationalisation agenda in very human and engaging ways.

Students’ descriptions reveal how the espoused curriculum becomes lived and experienced; through intellectual involvement and exposure to new people, places and ideas, to study and work routines, through visits and travel, the use of social media and virtual forms of communication and in friendships and communities of practice. As with all learning, not everything goes smoothly and tensions become apparent through the research. Being part of something new and exciting raises questions about those who are unable or choose not to be involved, or offer different contributions. Confusion around group membership, belonging and identity proves to a catalyst for deeper reflection. How students and academics work together in different places and less formal settings becomes interesting to think about. Beginning to question assumptions and preconceptions is both unsettling and liberating. Freedom to engage in social media and reportage produces authentic, contemporaneous accounts and images, which lead to important discussions of representation, use and ownership. Questions about how we learn through partnerships, and who we choose to partner with, and how such decisions are made, emerge as important areas for future discussion. Running throughout is the nascent sense of challenge to the established order of things – in age-old fashion, going away reveals the strangeness of home and makes taken-for-granted ways of doing things objects of interest.

Findings chime with discourses around internationalisation as a broader project, and with critiques of extra curricular ‘voluntourism’ activities (Tourism Concern, 2014). Grant (2012), in calling for a more international outlook, brings attention...
to UK and Euro-centric attitudes, and wonders whether fear and suspicion of the unknown on the part of academics is holding back a more wholehearted embrace of new partnerships. Emerging critiques of the ways engagement in learning focuses on ‘participation’ (MacFarlane, 2015) offer more nuanced appreciations of less well-explored ways in which students might learn from international partnerships – without traveling. Inevitably, the inequities between students are recognised and surfaced in work by King, Findlay and Ahrens (2010) and more recently by Bridger (2015), all of whom question how to ‘widen participation’ in international exchange schemes for students in less advantaged groups.

So notions of partnership, while ubiquitous, are far from straightforward. This report describes research into a collaboration designed with inclusivity and partnership in mind. Students of a regionally commissioned, regulated health programme at the University of Southampton are part of an international education partnership, which is becoming embedded into their curriculum. Funded by the Higher Education Academy (HEA) through its ‘Students as Partners’ strand, the research is part of a broader programme of activity. The aims of the HEA include being able ‘to support organisations to achieve strategic ambitions to enhance teaching and learning’ and ‘to improve teaching and the student experience’. ¹ The research was therefore required to:

1. increase understanding of pedagogical approaches that foster partnership;
2. provide evidence of the impact these pedagogies have on student learning; and to
3. offer clear implications for teaching and learning practice.

These overarching objectives informed both design and methodology of the study, and are returned to in the conclusion.

**Study rationale and aims**

The occupational therapy programme team at the University of Southampton is three years into the development of an ambitious, whole-cohort, staff and student exchange programme with their counterparts at Lund University, Sweden. The academics wished to inspire and motivate their students and to introduce them, as future global health citizens, to the international dimensions of their profession. Their unique model offers a template to others interested in such collaborations, yet other than immediate and unanimously positive student evaluations, academics had little robust understanding of its deeper educational value to students of the type that might be discovered through more fine-grained and critical feedback. Still less was known about the impact of the wider project, on students who did not take part in exchange visits for example, or in terms of the potential for curriculum innovation or even Faculty and University strategy.

Deeper inquiry was felt to be important too, if evidence was to be generated and shared with others beyond the health professions; for critique, adaptation and application. The opportunity to learn with and from students was presented by the Higher Education Academy (HEA) ‘Students as Partners’ strand of research.
Using the idea of partnership as a lens, we sought rich, in depth descriptions and perspectives, and of shared, communal and personal forms of development. Interviews generated detailed accounts of whether and how the collaboration’s espoused values and activities were enacted, by others and in plans and events, and explored how students experienced in their every day activities a sense of partnership working. Lecturers and practitioners who instigated and participated in the project were generous and open with information and impressions, providing important contextual knowledge and data. Students employed as co-researchers enriched and in parts transformed the study design, interview schedule development, data collection and analysis, and ultimately co-authored this report.

Findings, discussions and conclusions are intended to support future students and academics in developing international collaborations, and in better understanding how different pedagogic approaches that promote partnership working might be evidenced and applied in different disciplines and broader contexts.

**Occupational therapy: part of a global workforce**

Occupational therapy is interested in working with people to improve their wellbeing and health, through environmental and societal change as well as embodied means, and is rooted in a philosophy of social justice (Kronenburg, Pollard and Sakellariou, 2010). This is borne out in its history of women leaders who frequently relocated to develop schools, hospitals and community projects in all parts of the world (Mendez and Harris, 1992). A warm welcome was extended to occupational therapists travelling to and working in Britain; Yates (1996) used a prestigious lecture to compare the diversity of the profession in the past, with more recent trends. The World Federation of Occupational Therapy (WFOT) was established in 1951 and continues to thrive, although a recent decline in health students’ outward mobility has been reported (Carbonell, 2014). While global ambitions have to be balanced with national and regional workforce needs, the need for an intercultural skilled and capable workforce remains pressing given the health needs and variable outcomes of the UK’s diverse populace (Parliamentary Office of Science and Technology, 2007).

At Southampton, alongside many years of undergraduate education, a track record of productive research with peers in Lund University led to conversations among educators and researchers. They discovered an interest in a more educationally focussed collaboration, and since 2012, students have been invited to take part in short intensive visits to each other’s countries to carry out clinically focussed, evidence based activities. Feedback, in the form of anonymous questionnaires, was almost unanimously positive and included descriptions of transformative learning. For some students, it was their first time abroad. Others needed to make arrangements for childcare and other work and care responsibilities, reflecting a demographic typical of health professions’ students and found in a longitudinal study by Watson et al (2007).
Positive evaluations, while rewarding, raised questions for the academics: they wondered who they were *not* hearing from through the questionnaires, and whether students were reluctant to offer more critical accounts given the general air of excitement around the project, and an undeniable sense of gratitude towards the academics who had worked hard on its organisation and funding. As a programme team, they were curious too to discover the specific aspects of the collaboration that contributed to learning, and wondered whether this kind of ‘fieldwork’ – in contrast to assessed clinical practice – had a place in the curriculum.

The sustainability of the project and financial alternatives for the future led academics to be actively questioning, prior to the research being commissioned, how to capture and build on this unique experience, and how to elicit deeper and more critical feedback on which to reflect. Students with new and different perspectives on the project were equally motivated to share their learning, to contribute to future students’ experiences and several were prepared to invest time as co-researchers.
The broader context

The way the collaboration sought to improve occupational therapy practice, through its development of individuals with more informed and broader worldviews, accords closely with the Global Health Workforce Alliance (GHWA) perspective on the development of an international health workforce. Questions raised by GHWA revolve around how health students’ education can more routinely incorporate principles of collaboration, holism and interdisciplinarity, in the classroom, workplace and beyond (Global Health Workforce Alliance, 2013). Health services face considerable pressures across the world and share a need for skilful, knowledgeable workers able to utilise evidence, exploit technological advances, and above all, think pluralistically. To echo the words of the Global Healthcare Workforce Association (2013:12), health services are only as effective as the persons responsible for delivering them.

Global health goals and education

Throughout their careers health professionals, in addition to their caring work, need to influence events and decisions: ethically, strategically and politically (Kronenberg at al, 2010). Their undergraduate education is the first opportunity to establish such standards and to educate with these ambitions in mind. To this end Hocking (2014:591) proposes a new standard for occupational therapy education: ‘that all educational programmes state their commitment to contribute to societal change’, reflecting the need for ‘change agents in society’ identified by Global Health Workforce Alliance (2013).

Notions of intercultural capability

The hope of the Southampton-Lund collaboration to prepare occupational therapists for a new kind of international and intercultural professionalism has to compete with the immediacy of everyday clinical work, which is more immediately absorbing and emotionally stimulating than more abstract, future orientated ideas (Beckett and Hager, 2002). Educators nonetheless have the task of introducing such divergent sets of interests in ways that are coherent and engaging to students. Nigel Crisp finds one way to do so, describing the ‘global doctor’, in Willott, Blum, Burch, Page and Rowson (2012: 2):

‘All UK doctors, whether they choose to work in the developing world or as GPs in Britain, must have an awareness of global issues. It improves their critical thinking, enables them to empathise more with their patients and develops their knowledge of health systems, not least our own. The Global Doctor of the future will understand how the wider world fits into their practice, whether at home or abroad’

Knowledge has an important part to play in developing such understanding, yet moving beyond an intellectual interest to relationships, understanding and
practical, intercultural ability is clearly a goal of Global Workforce Health Alliance (2013). Attempts to cultivate such ability and interest through ‘voluntourism’ – short periods spent (typically) working with children in low income countries - are criticised as ‘doing more harm than good’: taking paid work away from local people, creating unsustainable and short-lived relationships with vulnerable children and others, and finally paying exorbitant amounts of money to travel agencies which might be used to better ends (Tourism Concern, 2014). Root and Ngampornchai (2012) found that even well organised, international exchange programmes within higher education are not certain to influence, at a deep level, students’ intercultural competence. In health education, a competence-based approach has been critiqued and gaps identified (Queensland Health, 2010: 13).

One answer to the limitations of a competence approach is a more holistic and ‘internationalised’ curriculum (Leask, 2009). However Scudamore (2013) considers that neither renewed content nor a focus on intra-classroom strategies necessarily serve to challenge dominant pedagogic approaches. If anything, her findings suggest traditional classroom-based education can serve to reinforce forms of learning and assessment based on language skill, rather than on thinking ability.

So we might ask, where do these findings leave educators wishing to develop such broader global interests and relational abilities in their students? Refuting the notion of individual attributes, or competences, offers a more fruitful avenue; Nussbaum (2007) describes capability as a contextualised, dynamic between person and environment. Places, goals, structures, tasks and processes become the means through which skills, values and socio-political awareness might be realised and performed. Viewed this way, intercultural capability requires socially and ethnically diverse student cohorts (Nussbaum, 2007), with time and opportunity to engage socially and intellectually (Arkoudis and Tran, 2010), in naturally occurring, informal and authentic ways (Bamford 2008) if it is to be a feature of a higher education.

Together the different perspectives from literature and educational practice influenced our research – its design, methodology and data collection - which became in itself an opportunity to take time to work together as a group of students and academics.
Methodology

Students as co-researchers

Bearing in mind Fielding’s (2001: 123) description of students as ‘radical agents of change’ and his call for more emancipatory and participatory methods, we made a commitment to work as a team of researchers with shared responsibilities. This required that we work with and around students’ placements and assignment deadlines if their limited time was to be spent to best effect. Students needed scope to dip in and out of the project without compunction.

Healey, Flint and Harrington’s (2014: 3) conceptual framework helped us to locate the research as ‘co-researching and co-inquiring’, somewhere in the overlap between ‘subject based research (global health) and ‘scholarship of learning and teaching’ (how do students report and describe their learning?). Its constructs helped clarify that student co-researchers were simultaneously engaged in reflecting on their own experiences to develop the research design and methods, and thinking in more general terms about how students are affected by their education. This required intellectual work to move between personal, descriptive accounts and more abstract, speculative discussions, during interviews and analysis.

The lead taken by our dedicated research assistant was pivotal: an Anthropology graduate between Master's degree and PhD, her closeness to the students in age and interests meant she connected with them in a number of important ways, discovered and reinforced through the visit to Lund. Only when contracts were signed could the invitation be made to all third year occupational therapy students to work with us as co-researchers. When six co-researchers were recruited and employed as temporary workers, the original proposal was revised following their examination and critique. The research tendering process several months earlier had required that the research question, design and methods be described in detail yet we found ourselves almost ‘beginning again’ as a new team with student co-researcher colleagues. The approaches they thought would best answer the research question, their methodological preferences, and importantly, their insights, skills and interests informed and ultimately improved the original proposal greatly.

Constraints and limitations

Perspectives of volunteer participants are in large part those of Southampton students who visited Lund. Of the Southampton students who did not visit Lund, only one volunteered for and was able to be interviewed and none completed the online survey. Two Lund students also volunteered and followed through with interviews. Several others volunteered but for various reasons were not able to be interviewed within the timeframe, hence the decision to make an online survey available.
Developing the research question

While background information was available in project reports and feedback, it was students’ words that interested us. Both the process of learning and the things learned were of interest. Notions of ‘partnership’ were implicit but not foregrounded.

The research question asked whether and how an international partnership in healthcare influenced occupational therapy students’ knowledge, understanding and sense of identity as global healthcare citizens, and whether they considered intercultural capabilities to be developed through their professional education.

Study design

The study was a small-scale, interview-based study in three parts. The research was conducted at the University of Southampton between September 2014 and June 2015.

**Phase 1** included a mixture of face-to-face and Skype interviews with Southampton students, conducted by six student co-researchers working in pairs, and supported and trained by the research assistant.

**Phase 2** included analysis of student interview data, early theme development and development of interview schedules for further interviews with Lund students.

**Phase 3** included further development and refinement of themes, followed by individual interviews with students from Lund University. An anonymous online survey evaluation was developed using adapted interview questions and emailed to the Southampton cohort.

Ethical approval

Ethical approval was sought for each phase in turn, to enable later phases to be refined in response to themes emerging from interviews (see Appendix 1 for further information). This iterative process served to maintain student involvement in developing the research as it progressed, building in scope for responsiveness and flexibility.

Student co-researchers were supported by the research lead and research assistant, in basic interview technique, confidentiality and legal issues, use of audio and management of data, consent and release forms.

Methods

Individual, in-depth, semi-structured interviews offered scope for reflection and openness and were something student co-researchers felt confident to
undertake. See Appendix 2 for example of interview schedule with additional ‘prompt’ questions and guidance. Subsequently the interview schedule was adapted and new questions developed for other groups or individuals being interviewed, such as the student who did not go on the exchange visit or those studying at Lund University. Volunteers were invited to make contact directly with student co-researchers and the research assistant, who conducted the interviews.

In April 2015, during phase three, interview questions were abbreviated and formed into an online survey seeking qualitative and quantitative responses, subsequently made available to the programme team to trial and use in future years. This was designed to offer an opportunity to any students who wished to contribute in a completely anonymous way to the research.

Recruitment of research participants

Volunteers were sought from Southampton’s 2014/15 HE Level 6 cohort of occupational therapy students and from Lund University final year students. A £20 book token was given in recognition and gratitude for the contribution, to all interviewees.

Data collection

Participants were considered ‘expert learners’; interview questions were active in tone, focusing on critical description, views and perspectives, in the way Holstein and Gubrium (1995) describe. Interviews were audio recorded and transcribed. Audio files were stored along with transcriptions according to University policy and the Data Protection Act 1998.

The research assistant took responsibility for overseeing recruitment, support, organisation and all data protection issues in relation to participants. Raw interview data was fully anonymised at the point of transcription.

Fourteen student volunteers were interviewed and twelve Southampton students completed and saved the anonymous online evaluation (see table below for breakdown). A further ten attempted the survey but did not save responses, meaning none of their data could be used. Gender and age range only were sought, and then only from interviewees: thirteen were female, one was male, and ages ranged from 21 years to over 35 years of age. Four of the six student co-researchers carried out ten interviews and the research assistant carried out four. While rich qualitative data given in survey responses influenced our interpretations and allowed for helpful cross-referencing, quotations in this report are taken only from interview data. Explicit consent to reproduce words as quotations was gained during recruitment and, in particular instances, again following analysis and interpretation as a form of member checking.

Data analysis

Analysis followed Braun and Clarke's (2006) six-stage analysis. Early interviews enabled potential ‘clusters’ of related ideas to be identified and developed, allowing an iterative process to take place as further interviews were conducted over weeks and months. New perspectives and descriptions emerged throughout the process of analysis.
Discussion of findings

Four broad, interconnected themes emerged that enriched and deepened concepts from the literature:

1. Meaningful relationships, purposeful partnerships
2. Cultural diversity, professional identity and a global community
3. Expectations, experiences and achievements
4. Reflecting, speculating and imagining: parallel perspectives

Students’ impressions tell us that, in the context of the Southampton-Lund exchange project, the concept of partnership acquired multiple meanings, taking on different forms and involving diverse actors and relationships. The whole-cohort approach to the ‘visit’ made the project exciting in its promise of an intense week working with fellow occupational therapy students in a different country.

Depending on their small group activity in mixed Lund-Southampton groups (referred to from here as ‘project work’), some of the students visited healthcare institutions and met individuals outside the University of Lund. Asked about the project work, they were able to describe how these experiences took place and how they influenced their learning. The establishment and development of meaningful relationships before, during, and after the visit to Lund, played a crucial part in the way partnership working took place between students, lecturers, and service users or members of the public.

The act of physically travelling to Lund to meet another cohort of students studying the same subject produced interesting encounters, conversations and events that invite the consideration of issues of hospitality, similarity and difference, and cross-cultural understanding. We consider how such experiences inform, and are informed by, collaborations based on more virtual or geographically distant relationships.

1. Meaningful relationships, purposeful partnerships

**Getting to know each other**

Travelling together, working together, laughing together, struggling with work together, living together. These were some of the expressions used by Southampton students to describe what they considered to be some of the most memorable aspects of their experience of the visit to Lund. Read in isolation, some of these things can be easily imagined to take place when a group of students travels to a different country and shares accommodation for that period of time (fun fun fun!). However, listening to each individual student’s impressions reveals that these are in no way superficial events, and that they played a fundamental part not only in their personal enjoyment (and development), but had an important influence on how their work took place.
during that week, leaving them with valuable insights, lessons to apply in future experiences, a network of “like-minded people” and, in some cases, friends.

Describing their reasons for going on the visit, some students emphasized their wish to meet other occupational therapy students, and to discover how the profession is taught and practised in a different country. Others added that they wanted to get to know the Swedish students and maybe find new friends. All of the students we interviewed found it relevant to meet and spend time with fellow students from another country, and many found that the experience contributed to a greater connection with other students from their own cohort.

Describing how relationships developed as part of the visit to Lund, students emphasized two aspects that, in their view, brought them closer as a cohort. On the one hand, they shared hostel rooms in groups of 6 or 8 and, as a student put it, “lived together” for a period of five days. Regardless of the challenges, for some this was a crucial opportunity to chat, to find out more about each other, and to bond in casual, fun and unexpected ways. On the other hand, the composition and organisation of the different project work groups, comprised of both Southampton and Lund students, made students more aware of each others’ presence and common origin, contributing to a sense of shared identity. This stimulated mutual support within the group (for example, when faced with the inability to speak Swedish and communicate with members of the public that they were supposed to interview as part of their project work).

The selection of groups by project work themes - rather than by existing friendship groups - also meant that many Southampton students worked together for the first time in two years of being on the same programme. Academics noticed how the visit transformed the usual dynamics of the cohort, recalling how they returned as a more cohesive group, and how this contributed to a greater sense of collegiality – not only among the students, but in their relationship with the lecturers as well. Asked about how she looked back on partnership working with lecturers during the week in Lund, one of the students replied that she found it “very beneficial”:

... I think, we got to know them better, which just generally helps us if we want to go to them with any questions, queries or concerns.

It's just nicer if you're working more in partnership and you feel more as a group rather than lecturer-student, so it took boundaries out of the relationship.

*Getting to know Swedish peers*

Travelling to Lund and working for five days with Swedish occupational therapy students was an important way of developing meaningful relationships and engaging in immersive project work. Asked if they felt as though they had worked in partnership with Swedish peers, students invariably replied “definitely!” going on to describe the group effort that their projects required, and the common energy that they had summoned. Most students agreed that the week spent in Lund was extraordinary in its intensity: a short period of time, complex project work, a pressing deadline to compose and present their
projects, and a whole array of things they wanted to find out about each other and about each other’s countries, their health systems, socio-cultural practices and occupational therapy practice and education.

Some students affirmed that, despite the demanding work schedule that they had to follow that week, they were still able to enjoy themselves outside the University and explore the city a little. However, most found the experience quite strenuous because it was “crammed” in five days, and some felt that this prevented them from fully experiencing the opportunity of being abroad, spending time with a group of fellow occupational therapy students, and affected in some ways their learning experience.

One student said that she would have liked the chance to get to know the Swedish students outside the University, “in their homes, in their environment” and to chat about shared issues of interest outside the very theme-focused project work.

*Wanting to be ‘good visitors’*
Several described their experience of the first day as “very rushed and “too busy” and questioned the decision to schedule a lecture to start shortly after they arrived in Lund, after a long journey and an early start.

> Boom! As soon as we arrived we were straight into work, there was no time to really like come down and relax... it was all very, very rushed on that first day

Some described feeling “embarrassed” and “frustrated”, being too tired to actually focus on the contents of the presentation, and many of them feared “falling asleep”, something that could be read by the lecturer and the rest of their hosts as “inconsiderate” or “rude”.

However, many of the students who described the week as being very “busy”, “intense”, “stressful” and “hard to cope with”, confessed that the pressure of time was, overall, a good thing. In their words, it was “a challenge, but a good challenge” and “difficult, but a good thing...”. One of the students described how despite being faced with common difficulties and frustrations, “we still worked together to make sure each other were doing okay with their own projects and things”, and admits that sharing these challenges turned into a rather bonding experience:

> I think actually it almost brought us together because it was quite frustrating and tiring; I think that was an aspect that actually probably brought us together a bit more.

For some, being able to manage the intensity of this experience increased their self-confidence and brought them a “sense of personal achievement”:

> Although it was a really, really stressful week that went very, very quickly and was very fast paced...I’ve come back with this sense of achievement, personal achievement, because I’d been quite poorly in the summer and I didn’t think that I was going to be able to make it
A common identity

Students’ different impressions of how their work developed had at least one thing in common: they express how the intensity of their involvement with each other, and the sense that they “were all OT’s” and “like-minded people”, influenced the success of their small group project work.

One student emphasised how, when the group was struggling to find a way of leading their project, they spent a long time discussing important issues, and found that they were “struggling together, struggling with the same things” and trying to figure things out together. Students cited good relationships, which developed in many cases into friendships, as fundamental to cope with and build something together in such a short period of time. The pressure of time, on the other hand, was also seen as an important trigger for closeness and shared dedication, and fostered good project management and fair assignment of workload. One of the students explained how the partnership with Lund students seemed to be enhanced both by the opportunity to socialise and spend time with each other outside the University, and by a strong sense of working together, collaborating on “more than a superficial level”:

I think just the project as a whole, working together, putting together the power point, deciding who was going to read it out... that was all working together.

And also the fact that we met up with them out of Uni or Uni time as well, kind of showed that we had collaborated on more than a very superficial level.

Casual, informal moments and exchanges were seen as important to the success of the project, generating both collective and individual enjoyment and enlightenment. Students described how relevant it was for them that they had “a bit of work, then a bit of a chat, then a bit of work”. One of the students described Fika time, the Swedish equivalent of the British “tea time” or “coffee break”, as a valuable and insightful opportunity for socialising, important for establishing relationships and influencing students’ personal development.

I learnt that fika time was great, and actually those who didn't participate in fika... they lost a great networking opportunity and information finding opportunity.

..it’s a really, really valuable tool because people were getting together and discussing things that you might never find out if you didn't have that opportunity.

Working with lecturers

Regarding their relationship with lecturers during the visit, students’ experiences and opinions were divided. The diversity of answers concerning whether students considered that they had worked in partnership with lecturers varied not only according to the type of project work that they were developing (and the lecturers assigned to each of the groups), but also in relation to personal ideas and beliefs about what could have been planned (or could have happened)
to bring students and lecturers closer together inside and outside the classroom during their week in Lund.

Some of the students worked in groups where at least one of the lecturers was very familiar with the model or tool to be explored during the week. For example, the ValMO (Value, Meaning and Occupations) model (Eklund, Erlandsson, Persson, 2003) focused on how occupations may be analysed according to values and meaning, and was created by a Lund University lecturer, who was invited to participate in some of the group's meetings where students presented their work as it progressed, and were able to pose questions and receive specialized guidance. For the students working on this topic, this was a unique opportunity to work in close contact with an academic who developed relevant research in their field.

One of the groups reported feeling particularly supported by staff after they submitted, together with Lund peers, an abstract to a conference in Washington, USA, and got their poster application accepted. Members of this group felt that they worked in close partnership with lecturers, who backed their work, commented on their poster and provided valuable advice that contributed to its improvement.

Other students reported that their relationship with specific lecturers was strengthened as a result of working on their projects during the week in Sweden. One of the Lund students interviewed described “creating a good contact with a lecturer”, and how “our lecturers were always there ready to help, and were quite open”. This same student observed:

[In] our group, our two lecturers were Swedish so I didn't have contact with the English lecturers. ... so I didn't really get a chance to get a taste of what the English lecturers were like or ..how they worked.

One of the British students described how it had been “nice to speak to some of the Swedish lecturers” and how she thought they had become “a little bit closer” with the Southampton lecturers as well: “we had that sort of friendly sort of relationships with our lecturers, when we went away.”

Other students found that they would have had felt more as though they were working in partnership with the lecturers if there had been a chance for them to be more available to chat about how the exchange was working, particularly in a more informal context or outside the University:

... we didn’t see them in the evenings, and it felt a bit like a disconnect between us. And I think it would have been nicer if we would have at least had just one meal out together. ..We could've talked about how our day was going.

Overall, students felt welcomed to speak to lecturers at any time, and were confident of a response, as one of the students noted: “Our lecturers were always there if there was anything that we needed”. Some of the students emphasized how important it had been for them to have the support and enthusiasm of their lecturers while they were in Lund:
...the enthusiasm of the lecturers transferred to the students which then made us more confident and helped us with our abilities to actually perform the things that we did over there.

At the same time, students recognized the benefits of a certain degree of autonomy and independent responsibility, “which at times allowed us to work better”. Some groups found that it had been beneficial to strike a balance between working with and learning from lecturers, and being able to work on their projects independently.

The Lund lecturer, we had some time with her, but she sort of just let us get on with it. We organised with her and she was really good at getting us focussed in our first initial “what are we going to do”, but then we just went and did it.

But that was quite nice because there was never that “Oh there are lecturers in the room and we have to act a certain way or we have to be good”. It was probably a bit more relaxed without the lecturer.

Students recognised that there was a strong partnership between the lecturers of the University of Southampton and Lund University. Some students remarked that, even if they didn’t see how that partnership worked and developed with their own eyes they assumed there must have been a close relationship between the staff members of both countries, even just to make the whole collaboration possible. As one student put it, “it worked quite well for them as well, so although I wasn’t actively watching this unfold I think it did happen”. Some students recalled seeing the lecturers laughing with each other and discussing how some things were done differently in the UK and in Sweden, which they interpreted as signs of a shared sense of involvement and partnership. Students also recalled finding it useful when the Lund and Southampton lecturers were able to get together to discuss the group work the students had been developing and give them feedback during the week in Lund.

**Other kinds of partnerships**

Meeting and spending time speaking to members of the public, patients and people using services was described as one of the most memorable parts of the visit to Lund. Asked if she could tell us about her experience in Lund, a student commented:

Awesome…It was very, very tiring, quite intense, but to have the opportunity to speak to real people while we’re out there, to speak to people that actually use the health service and find out what their views were

Another student said that, for her, this was the most memorable thing about the visit:

I think spending that hour with the lady in the community and just hearing her story… I think that's the thing that sticks in my mind the most… actually seeing her perspective and speaking to her… I think spending the hour with her was really the best
Access to people using services depended on the thematic focus of each work project, so only a few were able to have this opportunity. In the same way, one of the groups’ research project work was largely based on interviews conducted with members of the public, providing the opportunity to spend time speaking to Swedish people they met on the street and who agreed to be interviewed for their project. Asked whether they had the chance to work in partnership with Swedish service users and/or members of the public, all the students who had the chance to be in touch with these persons felt like they had worked, in one way or another, in a looser more informal type of collaboration or partnership with them. In most of these cases, students spoke of the importance of “listening”, of “paying attention to people’s needs and opinions” and of developing meaningful relationships in their interactions. They were aware of the influence these notions had to the potential of working in partnership (including in their future practice). As will be further described below, these encounters provided very relevant opportunities for learning and for personal development.

2. Cultural diversity, professional identity and a global community

Similarities, differences, and preconceptions

Asked about their motivation to go to Lund, most students stated their wish to travel, to “experience a different country” and to learn about its culture. Many said that they had been looking forward to meeting and working with the Swedish occupational therapy students, and to finding out more about “how they do things out there”, “seeing what occupational therapy is like over there”.

Going to Sweden was, for most participants, an opportunity to review their own ideas of cultural “difference” and “similarity”, and the experience of the visit produced interesting and nuanced impressions both on the Swedish and on the British students interviewed. The experience of this encounter was differently framed by individual students, and was described by many as a tension between the idea of a shared understanding of occupational therapy, and an awareness of the diversity of socio-cultural contexts to be found “out there”. For many, the visit changed the way in which they thought about cultural “differences” and “similarities”, by revealing the complexity inherent to individual social, cultural and economic realities, and emphasising the importance of questioning preconceptions, assumptions and prejudices. In most of the participants’ opinions, physically travelling to Sweden and spending time with Swedish people in Lund proved decisive in this regard.

One of the students described how important it had been for her to see things with her own eyes and to realise how some of the things she thought she knew about Sweden were simply not true. As an example she told us: “usually you hear how other people in other countries cope, but in terms of accessibility in Lund, I found out that they are not that far advanced in accessibility for people with disabilities.” Another student explained that, considering Sweden and the UK,
“the cultures, where I expected them to be hugely different, they were quite similar”, and pointed out that, as a result of the visit to Lund, “I learnt not to go with pre-conceived ideas that the culture was just going to be completely different from ours, and that it’s actually easier to ask people about what their culture is rather than just second guessing”. She went on to reflect on how these insights could be “really good to take into practice, because we see so many cultures within Britain that, actually, if you are not sure of what they do then they’d maybe rather you ask.”

The issue of cultural diversity was a recurrent theme in these interviews, and it was interesting to realise the many different ways in which the visit influenced students’ perspectives on this matter.

**A sense of oneself as part of a global community of practice**

For some students, going to Lund made them think about occupational therapy as a practice that crosses borders and cultures, and proved that despite “cultural differences” and “language barriers”, occupational therapists in different parts of the world are united in their professional values, goals, and views of the needs of the people with whom they work. For one of the students, one of the most memorable things about the visit to Lund was the realisation that “we didn’t necessarily have the same first language and hadn’t met each other before, but we were still able to get along because we had the same sort of attitudes and beliefs because we were studying Occupational therapy”. In her view:

There is always going to be a reason... to become an occupational therapist, I believe that you have to have the right frame of mind, or the right attitudes and beliefs.

So it was nice knowing that even though they’re from a different country, they still had the same fundamental beliefs about helping people and improving quality of life and independence and things like that.

For many students, going to Lund to meet other occupational therapy students, lecturers and practitioners had an important influence on their sense of self as future occupational therapists, as well as on their sense of being part of a global professional community. As some students remarked, meeting other students who were at the same stage of their professional education, but learning in a different country, and being able to discuss how they saw themselves as occupational therapists, played a fundamental part in this process.

Speaking about the expectations she had for the visit, one of the students revealed that “I just wanted to meet more people who were doing occupational therapy, to gain a greater understanding of what their vision of [it] is compared to our own, which definitely happened.”

For some students, the project work they developed in partnership with the Swedish students increased their “knowledge of the wider professional network, and how things are done differently in different countries”. On the other hand, working both with the British and the Swedish students in Lund and “being part of a big group of OTs increased my identity as an OT, it made me feel a lot more
part of a group”. This student added that “it was just really nice to meet other people studying OT and find that we’re all wanting to do the same thing and have similar ideas”, and how important that was for “getting quite a feel for our identity as OT students”.

Meeting other students was described as an important contribution to “coming away with a more concrete sense of self” – by providing an opportunity for occupational therapists from different countries to interact and work together, this encounter made the idea of a “global OT community” more palpable and inclusive for many.

Asked whether the exchange made her feel as though she was part of this community, a student replied “I do more now... now that we’ve had some interaction”. She went on to explain how the encounter changed this feeling:

I think it was that realisation that there are lots of us out there and that you’re right here and you’re part of it. You’re going to go home, but you’re still going to be part of it.

Another student agreed that the visit made her “more aware of OTs in other countries”, and that “physically experiencing that was interesting”, but that “going there” may not be the only way of claiming membership to this international community. This student stressed the importance of “being able to use the social media, to be able to be in contact with other OTs around the world. That makes you understand the bigger picture. So it’s not just going to Lund”. In the opinion of another student, being able to participate in this exchange simply “re-established that” notion of being part of a global community: “I already felt part of a global OT package so to say, because on Facebook you have a lot of OT groups and they’re global”. For her, the exchange visit to Lund “has just reconfirmed that yes, it’s not all about us in Britain. Everyone everywhere is doing really really good work in OT”. Asked about how she thought it would be possible to sustain that feeling of belonging, she mentioned the importance of keeping an eye on these Facebook pages “because that’s really helpful”, and “maybe feel more confident to join other ones once qualified”. The same student emphasised that the sense of being part of a global community could also be improved “by keeping on with the research, doing research and sharing that with the world”, “because research doesn’t obviously just stay within Britain”.

*Realising complexities*

As a result of the discussion on socio-cultural diversity, opinions divided on the subject of working abroad. For some, the experience of the exchange made them feel more like it is possible to work in another country because, despite cultural differences, the profession’s principles seemed to cross these boundaries. For others, the increased awareness of social, cultural and economic differences generated new questions related to material inequality, to the need to consider and carefully manage fundamental cultural differences, and to the fear of being unable to fully understand and bond with people using health and care services in another country.
The tension between these dynamics were sometimes found to coexist in the opinions of individual persons, who confessed they thought they may have sounded as though they were contradicting themselves within the interview. One of the students began by stating that, arriving in Lund, she was “surprised at how recognisable OT was”, and how she had expected that “there might be more differences maybe, in how we view OT, but the broad kind of approach and philosophy seemed to be the same” – at least in Sweden, she added, because “of course that might not be the same in other countries”. Asked about whether she thought the visit had prepared students for the prospect of working abroad, the student explained that going to Lund “definitely made you realise that, in theory, you could work in another country as an OT, because other countries potentially look at it the same way as us”. However, when asked about her personal expectations and plans for working abroad, her reply focused on the drawbacks of speaking a different language, and the possible difficulty of bonding with patients or people using health services in a different country because they didn’t share the same cultural and historical background:

Although it did make me go “Oh! OT is the same in Sweden”, you know, there are similarities in Sweden as there are here, which potentially might make you go “I could work in another country”.

but I also think that knowledge of culture and the country and language and everything else is really crucial to being an OT. I think, actually, it was Sweden that made me think this.

Because I just thought, you know, it’s so important to be able to relate to people, and if you’re... when you don’t know anything, you know, you don’t know the history of the country, you don’t know culturally what people do, you just... I think it would be quite hard...

This student concluded by adding “I’m not saying that it is not do-able, but I think I would find it hard”.

On the other hand, students were able to problematise the issue of cultural comparison in other complex ways by reminding themselves that, besides what they saw as examples of socio-cultural diversity and similarity, there are fundamental differences in how countries work, in how different healthcare systems are organised, and how the nature and distribution of resources in different geographical and political contexts takes place. The variety of situations to be found around the world alerted some students to the importance of considering these factors when imagining a global occupational therapy community, and made them question any ideas that might arise about the universal applicability of the profession’s principles and recommendations. As a student observed: “You can’t just go to one country and say ‘oh why don’t you do this? We do it over in England.’ Other people might not be able to do it in their own country because of resources, problems of resources, or other casual problems”. For this student, for example, going to Lund was important because it made her “more aware of the differences”. The visit showed her that “although we might have the same profession worldwide, we do see things differently”, and she became more aware that “there’s a language barrier, and a cultural
difference within each country in how they actually perceive being OT or how they act as OTs”. On the other hand, it made her more aware that – along with issues of material inequality and access to resources – cultural differences, even if small, can make a great difference in how healthcare is practised in different places: “I’m aware of the differences in the different countries... it is all about a lot of casual differences plus how the actual system works, the health system works... And that affects what service people get.”

So these are some of the ways in which the visit influenced students’ ways of seeing the world and placing themselves, as healthcare professionals, within that world. Most agreed that their awareness of cultural issues, and of the international / global nature of healthcare had altered in ways that may play an important part in their future careers. This matter is discussed in more detail in the section below.

3. Expectations, experiences and achievements

Expectations

The opportunity to conduct in-depth interviews with students allowed us to capture the complexity of their impressions and opinions, particularly in relation to the expectations they had before travelling to Lund.

Most students reported that they were unaware of the list of goals that had been set by the academic staff. One student observed “I don’t think before [travelling to Lund] I really knew why we were going, I just thought we were going to do some group projects and it would be a fun exchange or something they wanted to set up for the future”.

For some students, the in-depth interview was seen as a good opportunity to reflect and to realise what had actually been achieved:

I don’t think it was really made obvious to us what the whole point of it was. But I don’t think that was necessarily a bad thing.

But I don’t think I necessarily thought about the things until this interview. ........

However, some students were of the opinion that it would have been beneficial to have more preparation beforehand, and that having been given at least “one overarching goal” would have been important to enlighten some of the students who were “not sure what the point [of the visit] was” before going to Lund: “I will throw myself into anything, whereas some people will be like ‘oh I don’t really know what is the point in this’, so they may not have gone on the trip for those reasons”. Interestingly, even students whose interview revealed how much they were influenced, and who provided rich accounts of their experience, didn’t seem aware that these transformations had actually taken place.
Again, I feel quite contradictory about Lund. Because I really did enjoy it a lot, and I feel really privileged and grateful that we had the chance to go, and I wouldn’t have wanted to not go.

But I am not sure how much it adds to me in terms of improving me as an OT or my practice.

This student suggested precisely that being introduced to some of the “aims and objectives of the visit beforehand” – maybe in “a session” to take place before the event – would have been helpful in this sense: “you know, made us kind of think about them before we went”. Another student manifested her concern about students’ wellbeing:

I would have liked a little more notice of what to expect before we went... especially for students who have mental health issues that like to know...

I know you can’t know everything all the time, but would have liked a bit more so that they could have got it organised within their minds. I think would have been better.

Students’ expectations for the visit and their opinion on whether the pre-visit preparation was satisfactory also varied according to the subjects researched within work projects. For some, a brief introduction was enough, and left them enough space to “work things out” together during the week in Sweden. Others thought the complexity of the subjects required more preparation, and that they would have benefitted from more time to get acquainted with the subject they were going to work on as a group beforehand – especially given the limited amount of time they had to develop their project together during that week. Asked whether there was anything she would have changed about the project, one of the students explained:

I would’ve liked to have known a bit more about the housing enabler tool before we went out, because it was very, very, very tight with time.

We did have a couple of journal articles that we read before we went, but to have that opportunity to really get to grips with the housing enabler tool so we could have made that project more enriched

Students’ openness to speak about some of the things that they thought could have been done differently did not, however, impinge upon their excitement, gratefulness and admiration for the people who made the exchange project possible. All the students we interviewed were eager to voice how much they had gained from participating in the visit, and many provided vivid examples of how it had affected or transformed them.

*Personal and professional development*

Every student interviewee who was, in some way, involved in the exchange project claimed to have learnt new things from this experience, and different individuals described, with different emphasis, how the visit to Lund improved
their confidence, confirmed their identity, transformed their views, raised their awareness of the need for cross-cultural understanding, and/or just generally influenced their well being and sense of self. This was attributed variously to new knowledge, improved skills, new career possibilities and ideas for future research or specialisation.

Many felt able to explore topics, models and assessment tools that have been created in Sweden and which are not routinely used in the UK, for example, the ValMO model, the housing enabler tool, and lifestyle redesign approaches. By being required to actually employ these instruments and principles, students were able to “learn by doing” and understand the implications and potential of new approaches. Working with service users and with members of the public made a profound impression in some of the students, and raised their awareness to issues they might not otherwise encounter in their education:

It has reconfirmed how the most important people are our patients, and that they really need to be listened to with respect.

So this housing enabler tool, the fact that it concentrates on just their home, when in fact… the community was the most important thing for these people who we were talking to…

..when we’re making up new tools or when we’re talking to people, we need to find out what’s meaningful to them, because that is what we’re all about, really.

For some students, working with these new tools allowed them to rethink theoretical concepts and practical issues in ways they had not considered before. Other felt more keenly aware of the potential that some of these tools and models have to be applied “not only in Sweden” but at an international level, contributing to raising the quality of Occupational therapy practice at a global scale.

Project work seemed to broaden perspectives and heighten awareness of potential career avenues. One of the students whose group project focused on lifestyle redesign observed “I don’t think I would’ve learned about lifestyle redesign if I hadn’t gone to Sweden”, realised that working in this area could be an interesting option for her future:

Lifestyle redesign .. did kind of make me rethink... differently.. I suppose it sort of made me go ‘Oh! I could go down that path.’

For some, doing research became, for the first time, a possible future career goal: “I hadn’t even considered research before and now I have”, a student remarked, affirming that the exchange had “definitely” altered her hopes and goals. The project work group which submitted an abstract to a conference and got it accepted, experienced a sense of achievement that became an important incentive to dedicate more of their time to doing research work.

*Working abroad*
The experience played an important part in bringing to the table the possibility of working abroad. Opinions and impressions divided on this subject – both in terms of what students hoped to achieve as professionals, and regarding their confidence and views on the implications of working abroad.

Some of the students stated that the visit had merely confirmed what they already knew they wanted to do and had planned to do for sure:

I’ve always thought that sometime in my life I would move abroad.

Other students said that “they were already doing it” since they were from a different country from the UK or Sweden and they had moved to one of these places to work and study. A small number had always wanted to work in the UK but felt more open-minded now:

I wouldn't feel as confident, but I certainly wouldn't not think about it – whereas before this trip I certainly wouldn't have even considered working abroad...

For other students, the visit was energising, encouraged them to travel more, and made them consider the possibility of working abroad quite seriously.

I’m already thinking “Right, there’s more out there, so what else is there that I’m missing?”

Because they obviously had a really different perspective so I imagine that someone in like Australia or Africa or somewhere would have another perspective.

During the interview, the student identified a specific example of how the exchange project might eventually inform and contribute to improving her healthcare practice. She described being more aware of the sensitive nature of socio-cultural diversity, and the need to think about it in her everyday future practice:

It made me realise again the whole [thing about] culture differences, and that you really do have to think about people and their culture differences. So if as an OT if I have someone coming in from somewhere else [I need] to think about ‘well, what do they believe?’ ‘What do they think if they're not necessarily British or been in England a long time?’

Because things are different and cultures are different. So [it taught me] to think about people and their cultures and not necessarily the person in front of you. And what you can do to help them, within their norm culture-wise, and adapting how you do things, or something like that – rather than just being like ”you’re just like me so I’m going to treat you just like me”.

Other students reported how the project work they developed in Lund brought them similar insights, “widening their views” and making them more aware of the importance of “good communication” and its influence on mutual respect and understanding in clinical practice, both in their relationships with other professionals and with future clients.
The development of meaningful relationships was described as an important part of students’ learning, and it was found to have contributed, on the one hand, to successful and productive partnership working and, on the other hand, to the creation and development of personal and professional networks, and an improved sense of being part of a “global OT community”. So despite “language barriers” and “cultural differences” for many, participating in the exchange project generated more optimistic expectations and made it clear for them not only that “it is feasible to be an OT in other countries” but that they can successfully pursue their careers abroad in places and contexts that they would not have thought about before.

New skills, and a new confidence about “what is possible” meant for one of the students: “I learnt that I can do it”. This is the longer version of her answer:

Okay .. I learnt that I can do it. You can go, and you can be part of a group, and you can go and do things.

It's very easy doing it in your comfort zone and a place that you know, but going out there is that step further, that little bit of a push just outside of a comfort zone. But yeah, I learnt that I can do it.

*Communicating and language differences*

A range of nationalities, ethnicities and first languages existed among interviewees so to avoid confusion this section refers students as being from Lund or Southampton; the exception being in direct quotes from students.

In one student’s opinion, refining her “communication skills” was vital to improving her confidence in establishing relationships and working in partnership. The issue of communication was a recurrent one. Many students found that working across languages was a challenging experience, and students from both countries explained how they managed this situation during their week together in Lund. Even though most of their conversations took place in English, one of the Lund students emphasised how attempting to work together in a foreign language proved difficult for some. This student described how, despite some Lund students’ impressive ability to speak English, several were not comfortable working in a second language and sometimes struggled to communicate, even though “they tried their very best”. This student described how some of the discussions had to take place in Swedish among the Lund students in order for the group work to progress.

Southampton students praised the Lund students’ English speaking skills, their willingness to work in partnership combined with their ability “to do it in a second language”, and the fact that “most of the Swedish people we interviewed spoke in English”. They found that “the Swedish students were brilliant and very, very accommodating” and noted “none of us spoke Swedish, which was seriously sad.” Some of the Southampton students mentioned how they realised that sometimes they needed to adapt the way they spoke to make sure they were understood by the Lund students and how this had been an important learning experience.
One of the students described how “we had to speak Swedish a little bit” in preparation for the final presentation. Overcoming the language barrier was a great achievement, and made her more confident about establishing relationships with people for whom English is not a first language. Some wish to learn other languages in the future; one revealed how the fact that the Lund students were so accommodating made this possibility seem less daunting:

People speaking English so that I feel comfortable, that gives me enough to learn a language as well. They were very kind when they spoke in English, but they also allowed us to learn from them.

All students interviewed agreed that the requirement to prepare and present their project work on their last day together in Lund gave them the chance to exercise and improve their public speaking skills. For some, this meant they had to “get out of our comfort zone”, do something they found daunting and difficult, and turned out to be a rewarding experience that both improved their confidence and successfully “enhanced our public speaking skills”. One of the Lund students spoke about how helpful this opportunity may have been for some of the students, “especially if you’re a bit scared about doing presentations” and particularly if there is a requirement to do it in a second language:

I wasn’t the one doing the presentation in our group, but the Swedish [student] who did it in English said that “it’s scary but I’m so happy that I did it”, and just liked to prove for herself that she could do it.

So I guess for the people who actually did it they were really proud of themselves and will benefit from that.

A sense of identity

Many students explained how the time spent in Lund influenced their sense of self, their identity as occupational therapists and improved their confidence in multiple ways. For some, this opportunity was an unexpected source of energy and motivation, improving their mental health and general wellbeing, and suggesting new personal and professional paths:

I feel more like an OT, I feel that my confidence has increased since returning from Sweden. At the end of last year, it was quite a stressful year, the second year, it was quite horrifically stressful, and it left me wondering if I was doing the right thing. But after going to out to Sweden and seeing all the third year students and how excited they were, and then coming back and submitting abstracts that we didn’t think were going to be accepted but were...

I think it has just built on everything that I knew I wanted to do, and has made me more passionate... and a bit more passionate to do research!

Other participants mentioned that the visit to Lund “was a really nice experience for us to do as a group” going into their third year, and described how it “made us a lot closer in our course” and “sort of re-ignited our passion for OT”. Others said that being able to manage the fast-paced week and intense workload, and
being able to successfully complete their project by working intensely together left them with “this sense of achievement, personal achievement”.

Using social media

For some students, learning how to use social media in order to record and share the experience of the exchange was seen as a really valuable achievement, and something that they would not have engaged with if it had not been promoted by the organisation of the exchange, who provided both equipment (iPads) and training for those students who volunteered to do it. One of the students described how she learned to be “a bit more technology friendly”, and how she had enjoyed using the iPad to take pictures, learn how to tweet, blog, and essentially be able to keep a diary of their experiences in Lund. This student also emphasised how she wouldn’t have done “anything like this” if she hadn’t been given the chance, and how it had been important for her to attend “the meetings with tech people” that took place before the visit.

For this student, using social media to “tweet or blog about our experiences in Lund” was a way of “making people aware of what we do as OTs”, and she felt that it would thus “improve the profile of our course, and of Occupational therapy.”

Other students who were less active on social media during the visit still praised the initiative, and one of them commented on how it was “really impressive that people that don’t normally use social media took it on, and kind of set themselves a talent... I think that was good, and I can see the value of doing that as part of the project”.

At the same time, many students commented on the importance of social media like Facebook to secure and develop their personal and professional networks after the exchange, and to improve their knowledge and identity as occupational therapists. Using Facebook to follow and participate in international discussion groups and communities raised their awareness of a “global OT community” and made them feel more included in it. It also turned out to be an important tool to keep in touch with the Lund students after their week together, in the same way that it had been important to use before they had met for the first time in Lund. Some students described how “knowing the names” of the students they were going to meet in Lund, and having the chance to chat to them beforehand via Facebook was a good way of “breaking the ice”:

We were able to ask them what the weather was going to be like, we were able to find out if there was anything that they would like from England to be brought over as gifts, so we brought over chocolate and stuff, so that was really nice and it kind of broke the ice a bit before we arrived.

Another student said that social media made it possible “to build up the first relationship and get to know each other” before they met and started working together in Lund.
Facebook has proved to be an effective way of keeping in touch after the exchange programme as well. While some students have created a parallel group where they can keep working together on their poster submission to the conference, others mentioned that simply having “formed a relationship and made Facebook friends” means that they can easily be in touch with their peers:

Now you can sort of use that at any time you want, to like go back and speak to them, or bounce ideas off them, or ask advice, or whatever. So that’s kind of... you’ve formed a connection – in the same as you could on a clinical placement with your supervisor.

You can go back to them, you can email them if you want to. It’s kind of the same thing. So it’s kind of widened the network really of people that you can go to.

Social media was also mentioned as a possible way in which the students and staff who stayed in Southampton may have been able to be more involved. The Southampton cohort’s private Facebook group was being updated during their week abroad, and a student observed: “if we put anything up there they would be able to see it”. In her view, however, this would have been a passive way of letting the other students know what was going on since she admits “I don’t think I personally had much contact with people who didn’t go to Lund, because I was so swollen up in the focus of Lund, and everything there, and the people that were there.” Other students mentioned how blogging and tweeting while they were in Lund may have made people in Southampton and elsewhere aware of their activities that week. One student noticed how some of the staff back in Southampton had been “quite active on twitter, and looking at the blogs and stuff”:

A couple of us had been tweeting a lot and writing a few blogging bits, so there was quite a bit of feedback from them. I know there were a couple from health sciences who were constantly responding... so that was really nice.

For students, most of their learning was tied precisely with the relationships, friendships and forms of partnership that they developed before, during, and kept after their week in Lund. The idea that these relationships are not only meaningful (some of the students speak of “the friends they made in Lund” – one of them is even coming to visit this summer), but that they can also be productive and form future collaborations, partnerships, or simply prove useful in providing advice or information, shows the potential that an exchange project that requires students to work together as partners can have to influence, improve or transform disciplines and forms of clinical practice – both on a local and on an international scale.

If we consider that an important part of this international partnership project consisted of the encounter that took place when the Southampton students
visited Lund, it may be interesting to compare some of the ways in which the students who were involved differently in the exchange project perceived their own position and imagined other students’ experiences. We were able to interview two of the Lund University students who worked with the Southampton students during their week in Lund, one of the Southampton students who was unable to join the visit to Lund but who nevertheless participated in the parallel virtual communication events, and one of the Southampton students who both participated in the whole-cohort visit to Lund and was able to return to Sweden shortly after for an individual three-month Erasmus exchange (between January and April 2015).

Looking at these quite different perspectives allowed us to consider how the exchange visits seemed to make students more in touch with their own impressions and opinions, and more aware of how others may have felt about the experiences they went through together, or the experiences that some of them may have missed out on.

**Going and not going to Lund**

For different reasons, some of the students who were part of the Southampton cohort were unable to join the visit to Lund. Since the international exchange project was planned to include not only the physical encounter between students and staff from both countries, but also other forms of communication and collaboration through remote means (Skype/video-conference, email, blogging, twitter and Facebook), we were interested in finding out whether students felt any sense of partnership working with the students who did not go to Lund. Replies varied in length and depth, but most Southampton students who were able to travel to Sweden agreed that it had been difficult to feel as though they had been working in partnership with peers who remained at home.

Trying to explain why there had been “no grounds to really form a partnership”, some of the students spoke about the importance of “being there” and how they realised that “it’s difficult to form a partnership if they haven't experienced it as well”. These two students expressed their ideas about the difficulty of sharing and making other students “understand” a complex experience that they hadn't been through:

I felt that was quite tricky because it was an experience that, although you try to share it with the people that didn't go, there was always that element of ‘you don’t really understand because you weren’t there’.

I think that... it was very difficult to come back to the lectures about Lund knowing that there were a few people that didn't go and it was almost as if... If I was them I would have thought ‘why do I need to be here because it’s not something I’ve experienced’.

—

That was quite hard, I think. We did some work with them when we first came back, and some of them were really interested [...], but I think unless you’ve
gone and sort of experienced… I think everybody who went to Lund bonded a lot; through staying in the same hostel… and we bonded a lot just like generally being around each other 24/7 […] I think it was really lovely.

So the people that were out of that unfortunately missed something that… it was quite hard to sort of explain the experience, especially when a lot of it is just about being somewhere and sort of picking things up. Yeah, it was quite hard to explain, and I think as interested as they sounded… it's hard to connect with something you haven't been involved in.

Some of the students spoke about the awkwardness and difficulty of sharing their thoughts and experiences with the students who were unable to travel to Lund because they believed that those students had missed out on something important, and felt a degree of guilt or fear that the other students might be left feeling “ostracised” or “left out”. One of the students confessed:

I think I felt a bit self-conscious and a bit sorry on the occasions when we did talk about Lund with people who hadn’t gone, because, I mean, they probably didn’t mind, but I felt like it was a bit… I felt that they might feel a bit out of it and a bit excluded.

Another student explained this situation by providing an example of a specific aspect she feels she would have missed out on if she had been unable to join the visit to Lund:

I do feel for the people that weren’t able to go because I think it was a very… it was a really missed experience.

Some students highlighted the need for better communication, and suggested that some of the disconnect between the students who did and the ones who did not go to Lund may have been caused by the failure to involve them in related group activities. They suggested that, since some students were unable to travel, these events could have taken place in Southampton, remotely and simultaneously with their project work in Lund.

I don’t think the people I know have really engaged with us and I don’t think we even engaged with them properly.

I think they felt ostracised maybe because they didn’t go and there was no opportunity for them to listen to talks or anything like that because there were tech problems, so they didn’t have access to any of that, or they weren’t involved to do any work at university while we were over in Lund.

It seems light years apart, the people who went to Lund and the people who didn't.

This student also highlighted how there should have been “more information given to” the students who stayed in Southampton and that “their input” should be valued and listened to as well. Friendships within the cohort seem to have also influenced the degree to which students were involved in the activities that took place that week.
One student’s experience of staying at home

A student who was unable to go to Lund explained how, although she felt “a little bit left out of it all”, felt she was still included in the discussions and in the progress of the work of the group she was going to be part of if she had travelled to Sweden, and was able “to gain something from it”:

Hm, I did feel a little bit left out of it all, I think. But it was nice because all of the students that did go to Lund kept in contact with me. I don’t know if they did with the other students, but I was updated in what they were doing, and the group that I should’ve been in whilst I was there, I spoke to the students that went and they told me what they did, and what they learned from it, so I did kind of get feedback from them. So I was able to gain something from it, I just didn’t participate myself.

In her opinion, the invitation to be interviewed and take part in the present research project has also played an important part in her feeling more included in the whole exchange project experience:

When everyone came back and they were talking about this research project I didn’t really feel I could get involved because I hadn’t been [to Lund] and I didn’t really know what had happened, but it’s nice to be involved in that I get to be a part of this, and I get to give my opinions of staying at home, so I feel involved in that way.

It was interesting to observe how so many of the feelings that this student experienced matched the impressions and opinions voiced by many of her peers:

I think it’s opened my eyes a bit more and I think it’s encouraging me to not be quite so narrow in what’s going on here and now, and maybe to look elsewhere for ideas or inspiration, or even support. [...] Maybe there’s, you know, OTs working in other countries that really specialize in an area maybe that I might see in the future so, I don’t know, it has just kind of, yeah, broadened my horizons. I think.

She also spoke about how participating in the exchange project, even if remotely, enhanced for her the notion of being part of a “global OT community” and improved her sense of self as an OT:

I think it’s good to make contact with OTs in the rest of the world. Not just for finding out what they do and then bring their practice over, but it’s just to know that… I don’t know, that we’re all working towards the same goal, I guess. Even though we’ve all trained in different places, and we’re working in different cultures and countries, it’s just… I don’t know, it makes me feel even more excited to be an OT, I guess. Because there’s hundreds of other OTs out there and, yeah, it makes me feel part of a bigger community, other than just this community.

At the same time, there was an interesting contrast between the energy and renewed motivation embedded in the statements given by the students who travelled to Lund, and the slightly more shy and restrained resolutions expressed by the student who stayed at home.

For me still I’m… I don’t know, I guess I want to know what’s going on in the wider world. But, I don’t know, I guess I’m just happy with what’s happening here and around me. Um, I’d be interested in terms of reading about it, but I’m not sure… I don’t really know…
As described earlier, some students who were initially less open to travelling and working abroad, for example, revealed how the physical visit had a powerful transformative effect on their professional and personal hopes and ambitions, suggesting that going to Lund may have been an important opportunity for making them more welcoming of change and less reticent about widening their future plans and ideas. At the same time, the interview with the student who stayed at home highlights how individual students may have benefitted in very diverse and personal ways from the idea or possibility of going, and by their friends’ experiences of the visit. Despite being “quite happy to continue working in this country” she had been affected:

But now, after this project, and seeing what all the other students have brought back... I think it will help us as future qualified OT’s to change practice by maybe looking not just in other teams that are in the UK, but teams outside of the UK, maybe they’re doing something better, that we could be doing here as well.

So yeah, I think it’s a really good idea, and it was a really good opportunity.

Having had the chance to interview one of the Southampton students who did not go to Lund provided an important opportunity to compare different perspectives and emphasise how, in future partnerships, much can be gained from attempting to understand alternative ways of involving students in international projects. At the same time, this interview proved the importance of actually listening to students who are prevented from travelling but who, at the same time, feel like they are “still a part of it”.

While other students who did not go to Lund may not share these feelings, it is still a valuable contribution to understand the potential for forms of involvement, and the extent to which the Southampton cohort as a whole was affected by this international exchange project.

**Enduring connections**

For most students involved in the exchange visit, the issue of length of stay and involvement was an important one. However, Southampton and Lund students’ views and suggestions to improve the international partnership experience were somewhat different in their nature and intensity.

Most Southampton students mentioned that it would have been good to have stayed a week longer to be able to complete their group work at a different pace and, at the same time, to have more time to spend exploring the country and getting to know the Lund students better. Some students felt that they would have gained a lot more from the experience if they had been less tired and under pressure of time. The Lund University students, on the other hand, suggested that in order for the exchange project to have a real impact on their lives, their connection with the Southampton students should have extended over a much longer time-frame, in ways that could be virtual only, but which would nevertheless enhance their connection, sharing of mutual interests and concerns.
Expressing thoughts on whether this experience would have any influence on future hopes and goals, one of the Lund students explained that “it was just a short timeframe” and how “if it’s one week out of a three year education there’s not much to affect [...] your future”. Going on to explain how the project generated a sense of being part of a wider community, the student felt this could have been improved by organising and establishing a more enduring form of contact and collaboration, starting on their first year:

It’s a bit more of a global community than I think I would imagine actually... but, as I said, it was such a short time period [...] I think if there was [...] a little bit more contact, maybe it wasn’t just one week just being together and then never seeing each other again...

Maybe if it started off and in term one, and then you might have contact maybe over three terms out of your six terms, just more contact, then it would seem like you were a part of a global net thing.

But just one week, one week out the blue? It’s kind of hard to create something sustainable, you know, it just gives you a taste of something.

The other Lund student that we interviewed expressed a very similar idea. She found that the opportunity to actually physically meet the Southampton students was crucial for her own personal development, and was “very happy that it wasn’t only a Skype thing, or email, or something like that”. This student explained that the briefness of the exchange event may have caused it to lose some of its potential impact and richness. Asked if she could think about any other forms of international collaboration and partnership that wouldn’t require people to travel, she suggested:

I guess you could do a web seminar, but I think then it shouldn't be just a one-time thing. It should be something you maybe did at the beginning of your degree when you start at the first year, and then maybe again at in the second so you see each other grow somehow.

Otherwise I think, to me, it would lose interest. It would just feel like another thing that I have to do.

At the same time, both Lund and Southampton students admitted that they found their own strategies to prevent relationships from being lost after their week together in Lund – using social media like Facebook, exchanging phone numbers and emails were some of the ways in which they attempted to cement a connection between the two countries. We were told how at least some of these relationships were successfully maintained, leading to the development of work projects, friendships, and wider networks of support.

13 weeks in Lund: a “life-changing experience”

After the one-week whole-cohort visit to Lund, there was a chance for one of the University of Southampton students to return to Sweden to take part in an individual three-month long Erasmus exchange programme at Lund University.
In an enthusiastic interview with one of the student co-researchers, the student spoke about what she called “a life-changing experience”, and highlighted how the initial exchange visit to Lund played a fundamental part in her decision to apply for the longer exchange programme, triggering an important “chain of events”:

Now that I’m thinking about it, the chain of events that it’s caused is actually quite life changing, I think. It’s only when you sit down and think about it... what chain of events that processed for me.

As asked particularly about her experience of the whole-cohort visit to Lund, this student described in great detail how much the experience of “being somewhere different” and “looking at stuff in a different way” had influenced her. She emphasises how, although she “really enjoyed the project work”, that wasn’t the main “thing that stuck in my mind”. For this student, it was more “generally the experience of being there, and just seeing how people live in a different country, and their attitudes and things” that ended up having a “really positive effect” on her:

At the time I think I was getting a bit like stuck in a rut, in Southampton, just slogging away at university, and things like that. So to get a completely different look at a different way of life, a different lifestyle... it was really refreshing.

And actually I came away from it... just reviewing how I was as a person [...], so I ended up doing more exercise and I ended up just being a little bit more positive.

And I think it was just the shake-up of being somewhere different and looking at stuff in a different way.

The student describes how much she hesitated before submitting her application to take part in the longer exchange programme, explaining that she was almost too nervous and fearful to bring herself to actually do it:

I was so nervous about doing it and I literally had to force [myself]... we had to write a personal statement, and I had to force myself to give it in because I knew that I would be kicking myself if I didn’t go for the opportunity.

But it was such a scary prospect that I almost didn’t want it to happen.

Later in the interview she explains why she had been so worried about the possibility of actually getting the chance to go to live and study in Sweden for three months:

I was really nervous about going because I was [...], socially I was quite worried that I was going to be... that I wasn't going to make friends, and that the people weren't going to like me, and things like that.

And then I got there and instantly made friends; they had a really good sort of international student welcome, so you met a lot of people, and I’ve made really great friendships.
She goes on to describe how having submitted her application to take part in the individual three-month exchange project “was honestly the best decision I could have made”, how “seeing as it happened, I was really excited, really happy as well as anxious”, and how it’s made her “feel really positive, really confident”.

This student noticed how living and studying in Lund for three months had a fundamental transformative effect on her “as a person”, as well as on her political views and on her awareness to relevant contemporary social and cultural issues. The student reported how this experience “really refreshed me as a person, and made me think differently, sort of personally”. Living in Lund and seeing how things work in Sweden made her “more political”, “more leftist”, “more of a feminist”.

I love talking about this. I actually wrote down sort of things that I’d notice about their culture and things like that …

They’re much more equal [in Sweden], so I think I’ve become more political, and … more of a feminist.

I’ve become more leftist, I’ve become more political. I’ve started to think a lot more about how we treat each other in England.

For this student, thinking about the way people “treat each other” in both countries was a key to become more aware of how different power structures and governmental systems operate and how they actually influence and shape people’s lives. Although she admitted “I might be looking at it through rose tinted glasses”, this student mentioned the issue of education to provide an example of how “Sweden have got it right in a lot of ways”:

…they look after each other. I might be looking at it through rose-tinted glasses, but I can see that that education is free; it is giving people opportunities that a lot of people in England don’t have, because of our sort of government system.

And it has just made me more passionate about that, and about how people should be living.

Providing a detailed description of one of the placements she did in Lund, this student mentioned how going out and “working with a big immigration community” was “really influential” to her. Besides giving her “insight” and “more confidence to work with people from different cultures”, seeing how in Sweden “they had different projects to sort of bring communities together” made her wonder about bringing some of the approaches she observed back to the UK as well, and begin to think “about what we can do with our societies that can be quite marginalised”. She emphasised that she had “never really had that experience on placement in the UK” and that it “made me think really differently”.

Living and studying in Sweden for three months had a profound influence in her way of thinking about work – not only her own academic work, but also the different dynamics that operate in workplaces, from the way employees are
treated, to the way colleagues relate to each other, and they way work load and work hours are managed. She found that people were “culturally, much more laid-back” and how “that has made me more relaxed [...], not complacent, but just more relaxed with my studies”.

..in England .. we get very stressed out. In Sweden people are much more relaxed; their working practice generally really struck a chord with me... They actually give each other time. They take time, I think like once or twice in the day, to sit down with each other, to communicate with each other.

Besides improving this student's well being, seeing how work takes place in the settings where she was on placement, observing “their working culture” was an important learning experience:

I'm sure it's much more complex, but I really picked up stuff about their working culture. I picked up so much stuff that really make me question our practices in England.

The chance to be “out there for three months” played an important part in this student's sense of self and identity as an occupational therapist, and has made her become “a lot more independent”. These are some of the main reasons why, in a review of her experience, she encourages “anybody to get involved in anything they can, if it's involving going abroad”:

I just think you learn so much about yourself, about being an OT... you just get a lot more independent and it's that challenge isn't it? It's pushing yourself to the challenge. And it's nerve wracking but you feel amazing as you're doing it, once you've achieved it.

The experience described by this student exemplifies the relevance that longer term exchange experiences may have on individual students' lives, influencing not only their “learning experience” but actually leaving enduring impressions, transforming personal beliefs, producing new political attitudes.
Conclusions and implications

Our brief was to increase understanding of the pedagogic approaches that foster partnership working, to provide evidence of their impact on student learning, and to offer implications for teaching and learning practice beyond health disciplines. Our own understanding has been deepened both by the students’ accounts, and by working together as a research team. We think there is much more to say about the latter that falls outside the scope of this report. Students’ detailed accounts and the meanings we construed provide forms of evidence that their learning was affected, at times deeply, reflected equally in anonymous survey responses. This final section therefore concentrates on the broader implications of our findings, as we seek to intertwine findings with six pedagogic approaches (or sets of principles) already well established in educational theory and research.

Fostering partnership working through pedagogic approaches: implications for teaching and learning

1. Working on real projects and shared concerns

Working on ‘real’ projects – by which we mean, those involving pre-existing challenges or goals, that involve others, require the intellectual exploration of ideas in practical ways, and have some hoped for outcome or conclusion - served to focus students’ attention on shared professional concerns. Projects seem to have united them - rather than focusing attention self-consciously and/or self-interestedly on group roles or performances - as agentic individuals, able to stand back and reflect on their own knowledge and understanding in mature and critical ways. Language differences, paradoxically, appear to have deepened this sense being individuals working in unity, at least among our interviewees. Differences in language made explicit, and served to reveal, the ‘hard work’ going into ‘group work’.

Projects were described as involving and motivating, enabling (some) students to connect social factors and health outcomes, and to see the evidence of different political and economic decisions on living arrangements and access to healthcare. Time constraints meant inhibitions or social awkwardness needed to be overcome in order to progress the task. The small groups’ need to draw on ideas and theories in order to explore practical challenges meant students made connections and drew conclusions rather than waiting for answers. Projects seem to have become catalysts for deep thinking and rapid immersion in topics, connecting with values and a sense of professional identity, requiring high levels of engagement beyond the student group (with others such as patients or with researchers and academics).

The rich literature that explores work based learning, learning by experience and learning by doing is familiar to more vocational disciplines yet can be seen to
have relevance to any mutually derived project work. Beckett (2009:7) is interested in the interplay between social and individual agency, and draws on Wittgensteinian concepts of intelligent action to assert ‘it is in the doing that the understanding is apparent’. In similar vein, Billett (2008: 39) talks of ‘integrating’ personal epistemologies with practical experiences, in the development of agentic professionals.

We can rethink much of the work of higher education in this way; archival research, fieldwork, shows, exhibitions, even short courses or modules, have characteristics of ‘real’ projects. ‘Real time’ necessarily means such plans are less amenable to control (or assessment and so on), and many of those listed are students’ own projects, meaning unique opportunities are afforded to learn about ‘things’ – such as uncertainty and complexity - and to simultaneously use feedback from peers and from events to revisit and appraise private knowledge and sense of self (Giddens, 1991). Making explicit the dynamic between these parallel ways of learning and the ways in which individual agency (and goals, desires, intentions) influence and become part of practical, shared decisions and actions, enables a more reflexive understanding of oneself as part of a social world.

2. Informal learning

Following the idea of real projects with meaning to and control by students, is the important message throughout findings; that learning together in informal ways was central to students’ motivation and enjoyment of learning. Not only did they value time together but some would have brought their lecturers into this freer space. Designated ‘social’ time (fika) enabled new insights and connections through which relationships were developed.

Not being assessed meant experimentation was actively embraced, leading to high levels of intrinsic and infectious motivation. Students were conscious of the trust placed in them, expressing this as a wish to be ‘good visitors’ and to show the profession and Southampton in a good light. This may also have contributed to what staff described as ‘gratitude’ when seeking more critical evaluations, but may also have been a sense of mutual investment; if evaluation is what consumers do, why would students criticise something for which they were jointly responsible, and could influence as it progressed?

The collaborative enterprise is still relatively new and changes will take place, however we feel strongly that the unregulated time, naturally occurring relationships, trust and freedom experienced and described by so many interviewees is vital to a sense of being in partnership. Each contributed significantly to deep learning, and to a ready engagement with pluralistic thinking described by Perry (1968) and so valued by Nussbaum (2007). We can surmise that greater regulation – for example assessment of outcomes or contributions - would have introduced comparisons, competition and an instrumental approach, fundamentally altering group working and relationships.
among finalists. Instead, experimentation and things going wrong become valuable learning.

We urge educators to create opportunities, with confidence, for the ‘deep hanging out’ described by Geertz (1998) and to resist the temptation to subordinate, co-opt or in other ways to appropriate powerful informal learning in the interests of instrumental goals even if there is pressure to do from students themselves or elsewhere (Usher, 2010).

3. High expectations, high support

Being expected to make contact with peers in another country, to manage travel and produce academic work together to tight deadlines, seems to have been motivating because it was stretching. Access to experts - academic, clinical and through lived experiences of illness or disability - meant practical tasks were informed by more theoretically informed and intellectually stimulating ideas. Small groups were left to work independently and were not ‘supervised’ by these experts, though we can surmise that their presence and influence created a high expectation of and by students. Forms of support were seen to come from peers as well as academics, so outcomes of project work were multiply sourced, rather than part of a binary, student-academic relationship.

The combination of high expectations and high support introduced reciprocity and collegiality into students’ learning, as they depended on one another, on academics and particularly on their hosts to achieve a good outcomes.

Participants reported building relationships with peers from both universities, and spoke of the ways in which they worked productively together. Those still in contact spoke of being involved in ongoing projects, notably taking a poster to an occupational therapy conference. This ambitious plan – also a ‘real’ project - is characterised by high mutual expectations, actively supported but most definitely not led by an academic. In addition, however, it involves personal relationships formed in the light of a longer-term goal. This kind of student/peer partnership offers a useful reminder that such ambitious plans might usefully be propagated, generated and made more inclusive through education programmes more generally. Kift (2010) asserts that a combination of high challenge and high support needs to be embedded early in the first year of higher education, if students are to become independent and lifelong learners. She reminds us however that support is what students experience it to be, not what is intended or judged to be by others. Discovering this from students through skilled evaluation and research is important if the high expectations are to be realised.

4. Communities of practice and circles of partnership

Relationships begun through social media introduced students to new ways of being part of national and international networks. The partnership between the two universities was conceived as an inclusive one made possible by
technological forms of communication. It provided a reason to learn to blog, to create a photomontage, to form new Facebook groups and to share creative outputs via these networks and others, such as Instagram, Pinterest and Twitter. The training in both style and integrity in online forums, as well as more practical help from student iChamps, was needed and appreciated, as was the involvement of Faculty staff not connected with the project but who took an interest and shared blogs, tweets and storifys. Such activities have potential to be much more effective in reaching out, and in actively promoting inclusivity, by supporting communications with and by students and academics not involved with visits.

However we have become interested in how what we term shared concerns - for a group, an individual, a region or a practice – can be promoted through membership of communities. The concept of shared concerns (in healthcare) emerged in previous research with work-based learners (Wintrup et al, 2013) as they described over-arching health goals or values that transcended different agencies’ priorities and as such were helpful reference points.

Wenger’s (1998) notion of a community of practice, defined as ‘groups of people informally bound together by shared experiences and a passion for a joint enterprise’ offers ways to develop this notion and to value varying degrees and changing forms of involvement over time according to students’ other demands and responsibilities. Sharing forms of reportage and orchestrating wider communications, for example, might be a responsibility of those who remain at home.

Networks offer ways to incorporate many different individuals and groups in a loose and evolving dynamic, opening the way for forms of partnership that change over time and according to task. Our contribution to this endeavour is explicated in a ‘circles of partnership’ exercise, an adaptation of Wintrup et al (2013:214), as we suggest how students, academics, professional and technological staff, managers and others with an investment in creating communities of practice in a discipline, might surface issues, ideas and opportunities, and negotiate in practical ways the shared concerns addressed and promoted through international exchange programmes. It is hoped that other disciplines might find the exercise useful in discovering / making explicit their shared concerns, and in working out how an exchange might further the interests of their wider communities of practice.

Circles of partnership framework diagram (jpeg) HERE

5. Embedding principles of care, hospitality and reciprocity in partnerships

Mann (2008) identified care and hospitality as core principles in higher education, fundamental to the maintenance and strengthening of the bonds between students, lecturers, and professional / managerial colleagues. Central to both is the notion of reciprocity, evidenced in students’ words and impressions throughout the research. While more instrumental goals of wanting to ‘visit’ often provided an impetus early on, we can see the emergence of care and
hospitality in more reflective descriptions of events and in discussions of relationships.

These principles also serve to connect the institutional partnership with the students’ learning about global health issues, as McEwan and Goodman (2010:103) remind us that an ethic of care requires thinking through our responsibilities towards “unseen others – both unseen neighbours and distant others – and to cultivate a renewed sense of interconnectedness”.

Exchanges that focus more explicitly on principles of reciprocity, care and hospitality, as well as on visiting and exploring, open up interesting questions and research possibilities for cohort peers and staff who remain ‘at home’. In doing so, they bring into the broader internationalisation project the potential of understanding ourselves as citizens of an international community as we inhabit familiar places; not only the University buildings but the streets and neighbourhoods of Southampton and Lund. We have become interested in how reciprocal, mutually energising projects, visits and connections within the same country, even the same town or city, might be explored through the lens of partnership and global health citizenship.

Adequate, facilitative technology needs to be part of care and hospitality, if lectures and events are to be streamed successfully, in accessible and inclusive ways across years and disciplines. The right equipment and training cannot only be available prior to an exchange visit, but needs to develop capability in all involved as part of the curriculum. Developing skill and confidence in technology and social media is a long term project for most and as such, might usefully be introduced to first years – using visits and exchanges as a reason to become involved and to begin relationships with peers across the world. Without an institutional and strategic commitment to care and hospitality, these operational initiatives are at risk. Ground-up initiatives inform institutional management of the opportunities for reputational enhancement while strategic / organisational support and direction enable individuals to be innovative.

6. Students as producers of high quality healthcare

Finally the impact on students’ learning of coming to see themselves as co-creators, co-researchers and producers, as one of a community of practice, is very exciting. Constructions of students as anything other than producers of education are rejected by Neary (2012), who describes a cross-institutional approach to research education as “a search for the ‘essence’ or ‘spirit’ of science”. This unifying strategy has similarities to the way students described their transnational discovery of a kind of ‘global occupational therapy’; co-created, emergent values and practices they recognised, actualised and felt ownership of, coming to embody the ‘spirit’ of their profession.

Final year students who participated in this research are largely now graduates, in every sense ‘producing’ health and care, more immediately and directly than their lecturers and researchers. However in Neary’s (2013) sense, producing is a
political commitment to society and to change that goes beyond conforming to the norms or expectations of others. The renewed vigour described by students, the articulation of ways of using intellectual means to explore complicated practical social problems, and the deeper, more politically informed understanding produced by seeing alternative ways of organising and resourcing health services, bodes well for students as individual and collective agents of change and for national and global health services more generally.

On working together

This research would not have been possible had anyone involved – the students who volunteered as participants or as researchers, their lecturers, or the research leads – been content with notions of ‘satisfaction’ as a measure of the worth of the international education collaboration. Almost everyone who took part was more than satisfied, as early feedback showed. Indeed students expressed delight and gratitude. Those who did not take part seem to have remained silent; how do you ask what was it like not going somewhere? It is to the credit of both Southampton and Lund academics that they wanted to question this appreciative yet selective response and to go further: to discover what was not working well; what, if anything, was likely to be of longer-lasting educational value; to hear dissenting voices; and to consider the experiences of those who were unable to be involved in the ‘visit’ to Lund. By not being satisfied with satisfaction, new learning was made possible.

We suggest the concept of partnership challenges established structures of power and influence and raises new questions. Across and within disciplines, whether in global or local communities of practice or in distant networks of shared interest, ‘partnership’ offers a useful reframing of not only student / academic relationships, but of student relationships with practitioners, patients and mentors. The ‘circles of partnership’ exercise offers ways for all students, and others, to contribute and to develop roles in such international projects, whether (for example) as social media reporters, as knowledgeable hosts, or as local researchers, in face-to-face or distant and virtual ways. Beginning such projects much earlier, indeed on day one of university, would enable relationships to be developed and interests shared between students, as suggested by interviewees, if subsequent visits are to be part of an international education, not the sole focus of it.

However if it is not to become yet another rhetorical device, partnership relies on a critical and questioning stance and a pluralist approach to learning that needs to be recognisable and most importantly, lived and experienced by students, across the curriculum. Taken to its conclusion, such a conceptualisation of the student / academic relationship has implications for the values and professional development of all who work in higher education.

Acknowledgements

We regret that it has not been possible to do justice to all the many generous contributions made by students and colleagues over the past year within the body of the report, or to recognise the support offered by those who took such an active interest in our research and encouraged us in so many ways.

*We therefore wish specifically to thank:*

All the occupational therapy students in Southampton and Lund who took part in interviews, who completed the survey, who considered and discussed the project with us, and who in any other way supported peers, passed on information and encouraged us in our approach. We valued your inspiration, interest and friendliness immensely.

All the academics in Southampton and Lund who took part in interviews, offered and corrected factual information and became part of our reference group, in particular Maggie Bracher, Ragnhild Cederlund, Pia Hovbrandt, Gary Kinchin, Sarah McGinley, Lance Bryant and Bernadette Waters. In particular we would like to thank Teresa Job, Programme Lead for Occupational Therapy 2008 – 2015 and lead for the collaboration in Southampton, who gave us *carte blanche* to research as we needed, responding swiftly and openly to our most awkward and delving questions.

Kelly Wakefield, who co-authored our original proposal to the Higher Education Academy.

Alan Borthwick and members of Southampton’s Faculty of Health Sciences’ ethics committee, for processing the three stages of our proposal and engaging wholeheartedly with the introduction of students as co-researchers.

Pia Hovbrandt, Ragnhild Cederlund and Lund University’s ethics committee for taking the proposal to ethics in Lund for the latter stages, also for engaging so supportively with students as co-researchers.

Fiona Harvey, Education Developer, Institute of Innovation and Learning Development, and Katie Spires, Student Nurse and Health Sciences’ Digital Champion, who continue to support Southampton’s students using social media.

Finally we would like to thank all our student co-researchers and co-authors who gave precious time during their intensive final year of study, at whatever point they were most involved. We look forward to disseminating findings with you and to your future research.
Appendix 1: Ethical issues and approval processes

Ethical issues and approval processes

The evaluation adhered to the British Educational Research Association Revised Ethical Guidelines for Educational Research (BERA, 2011). The following issues are highlighted here:

- Students’ involvement in the research needed to be completely independent of their educational experience or achievement. No educator or academic associated with students’ education was able to know who had participated (including the project lead). To ensure this, the dedicated researcher managed all participants’ identifying information and data, ensuring confidential treatment of material and full anonymisation of data. Student co-researchers worked closely with the research assistant to this end.
- Informed consent was obtained from all participants (see Participant Information Sheet and Consent Form).
- Participants were free to withdraw consent and data at any time.
- Information obtained during the study was treated as confidential with names or identifying features removed in the analysis and prior to the reporting process to preserve anonymity.
- Because of the potentially vulnerable nature of continuing student participants, only the research assistant (who has no involvement in the administration or teaching of the programme) knew the names of all volunteers, and keys to coded data. She oversaw the conduct the interviews and carry out data analysis in consultation with the research team. The project lead offered methodological supervision and theoretical input and offered advice to the research assistant on any issues arising, not covered by the normal procedures for Student Support / Complaint / Health and Safety / Ethical Considerations.
- Student co-researchers adhered fully to all ethical and procedural requirements of the study, including reporting any unforeseen or unanticipated issues to the research assistant. As third years only months from graduating as health professionals a high level of professionalism was required and anticipated.
- Student co-researchers were employed as ‘temporary workers’ through the university temp bank meaning they were paid on an ‘ad hoc’ basis for their work as part of the research team, properly managed and supervised and held accountable for their work.

Data protection and anonymity

The names of students who registered an interest in taking part in this study are stored in a locked filing cabinet. This information along with raw data will be stored for 15 years from collection as required by the University. It is used only to contact students at various time points regarding their participation in the study, for example to invite them to interview or to provide updates or feedback on the research.

Documents, interview transcripts and backups of interview data files are stored securely. Digital copies are stored in a password-protected file. Once a student consented to the use of their data or completed an interview, they were allocated an individual code, which was assigned to their data, digital interview file and their interview transcript. The key to the codes is accessible only to the research assistant during the research period and thereafter to the project lead. Within interview transcripts, names were omitted and changed in any reporting, to preserve anonymity.
Appendix 2: Example of interview schedule

<table>
<thead>
<tr>
<th>Interview questions, set 1: Southampton students who visited Lund.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A. Introduction. Refer to text describing project, reiterate consent / withdrawal of consent procedures and what will happen to interview data.</td>
</tr>
<tr>
<td>- introduce yourself</td>
</tr>
<tr>
<td>- explain the project</td>
</tr>
<tr>
<td>- conditions of interview, how long, types of questions, recording arrangements.</td>
</tr>
<tr>
<td>- confidentiality: remind them of conditions and arrangements</td>
</tr>
<tr>
<td>1. B. Assign participant number and date of interview</td>
</tr>
<tr>
<td>1. C. The Participant Gather demographic data</td>
</tr>
<tr>
<td>1. D. Main questions - Could you tell me about your experience of the visit to Lund?</td>
</tr>
<tr>
<td>Begin audio recording Optional / additional questions:</td>
</tr>
<tr>
<td>- What was it like? How did you find the experience?</td>
</tr>
<tr>
<td>- In relation to your project work, what was the project title? What did you do? Was it useful / interesting?</td>
</tr>
<tr>
<td>- What was most memorable about the visit? Is there anything you would have done differently? Was there anything you didn’t enjoy? Is there anything else you would like to add about the visit itself?</td>
</tr>
<tr>
<td>Optional prompts to elicit rich description: Tell me more about that? How did that work? Was that ever problematic? In what ways? Can you explain? Can you specify / give an example? Can you describe that? What happened next? What was the outcome? How were you left feeling? Was that a good thing? Have we left anything out? Is there anything you would like to add? Are there any other thoughts or experiences you would like to add?</td>
</tr>
<tr>
<td>- offer space for reflection / additional thoughts and comments before next set of questions.</td>
</tr>
<tr>
<td>2. The purpose of the visit: the stated goals and whether these were achieved in the interviewee’s view - The collaboration and visit to Lund was intended to achieve a number of goals. I will go</td>
</tr>
<tr>
<td>Give time to go through each question, judge speed / move on as appropriate.</td>
</tr>
<tr>
<td>Range of prompts may include:</td>

### Purposeful Partnerships and Practices

**30th June 2015**

The visit was intended to:

- Develop meaningful international collaborations between staff and students
- Allow students to develop a greater awareness of how academics can learn from each other, exchange best practice and evidence based practice to inform the curriculum.
- Through the visit, students will develop a greater awareness of these practices and be better prepared for the international work market / consider working abroad / feel more confident about the possibility of working abroad.
- Students will work in partnership, benefitting from the opportunity to work intensively together with the Lund students on educationally challenging and inspiring projects.
- Students will use social media to learn, communicate and work together.
- After a week long participatory programme including education, practice and research based workshops, students will report and disseminate outcomes through article and conference presentations.
- The visit will enhance students’ learning experience and exposure to international perspectives and comparisons.
- Can you think of any other goals – these may be personal to you or your group – that are not covered in this list?

### 3. New Learning

- **Did you learn new things?** If so, what did you learn?

<table>
<thead>
<tr>
<th>Tell me more about that.</th>
<th>How did that work?</th>
<th>Was that ever problematic?</th>
</tr>
</thead>
<tbody>
<tr>
<td>How did that work?</td>
<td>Was that ever problematic?</td>
<td></td>
</tr>
<tr>
<td>In what ways?</td>
<td>Can you explain?</td>
<td></td>
</tr>
<tr>
<td>Can you specify / give an example?</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Can you describe that?</td>
<td>What happened next?</td>
<td></td>
</tr>
<tr>
<td>What was the outcome?</td>
<td>How were you left feeling?</td>
<td></td>
</tr>
<tr>
<td>Was that a good thing?</td>
<td>Have we left anything out?</td>
<td></td>
</tr>
</tbody>
</table>

- Offer space for reflection / additional thoughts and comments before next set of questions.
Have we left anything out?  
Is there anything you would like to add?  
Are there any other thoughts or experiences you would like to share?  

- offer space for reflection / thoughts or comments before next set of questions.

4. Sense of self as an occupational therapist  
- Has your sense of yourself as an occupational therapist changed in any way?  
- If so, in what ways?  
- Has anything changed for you personally, as a result?  
- Has anything changed for you as an occupational therapist, as a result?  

Optional supplementary questions:  
- After the experience, how do you view yourself? Has anything been reinforced? Has anything changed?  
- Were there any other things you noticed?  

Prompts:  
Tell me more about that?  
How did that work?  
Was that ever problematic?  
In what ways?  
Can you explain?  
Can you specify / give an example?  
Can you describe that?  
What happened next?  
What was the outcome?  
How were you left feeling?  
Was that a good thing?  

Have we left anything out?  
Is there anything you would like to add?  
Are there any other thoughts or experiences you would like to add?  

- offer space for reflection, thoughts, comments before next set of questions.

5. Global health community  
- Do you feel as though you are part of a global health community?  

Optional supplementary questions:  
- What would enhance or sustain this?  
- How did the exchange specifically influence that? Eg relationships, people, knowledge, self awareness?  
- In what ways?  

Optional prompts:  
Tell me more about that?  
How did that work?  
Was that ever problematic?  
In what ways?  
Can you explain?  
Can you specify / give an example?  
Can you describe that?  
What happened next?  
What was the outcome?  
How were you left feeling?  
Was that a good thing?  

Have we left anything out?  
Is there anything you would like to add?
### 6. Your professional / personal goals

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Do you think this experience will influence your (professional / personal) future?</td>
<td>Reminder: It might be useful to differentiate between feeling able / more confident to work abroad and / or opening you up to the possibility of working abroad.</td>
</tr>
<tr>
<td>- In what ways?</td>
<td>Optional prompts:</td>
</tr>
<tr>
<td>- Has it altered your hopes or goals?</td>
<td>Tell me more about that?</td>
</tr>
<tr>
<td></td>
<td>How did that work?</td>
</tr>
<tr>
<td></td>
<td>Was that ever problematic?</td>
</tr>
<tr>

### 7. A. Partnership working

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Occupational therapists aspire to work in partnership with others. In what ways has this experience influenced / enhanced your skills in partnership working?</td>
<td>More in-depth questions as appropriate:</td>
</tr>
<tr>
<td>- Can you give an example?</td>
<td>- How do you look back on the idea of partnership – specifically with other students?</td>
</tr>
<tr>
<td>- Do you feel you were working as a partner with: students from Lund / each other / lecturers / patients or service users / others / OT students who did not go to Lund / staff who did not go to Lund?</td>
<td>- How do you look back on the idea of partnership – specifically with patients and people who use services?</td>
</tr>
<tr>
<td>- Did you see any other kinds of partnerships taking place, eg between lecturers?</td>
<td>- How do you look back on the idea of partnership – specifically with lecturers and mentors?</td>
</tr>
<tr>
<td></td>
<td>Optional prompts:</td>
</tr>
<tr>
<td></td>
<td>Tell me more about that?</td>
</tr>
<tr>
<td></td>
<td>How did that work?</td>
</tr>
<tr>
<td></td>
<td>Was that ever problematic?</td>
</tr>
<tr>
<td></td>
<td>In what ways?</td>
</tr>
<tr>
<td></td>
<td>Can you explain?</td>
</tr>
<tr>
<td></td>
<td>Can you specify / give an example?</td>
</tr>
<tr>
<td></td>
<td>Can you describe that?</td>

### Purposeful Partnerships and Practices

**FORM:** Page 30

**Date:** 30th June 2015

**Is there anything you would like to add?**

**Are there any other thoughts or experiences you would like to add?**

- Offer space for reflection, thoughts, questions before next set of questions.

---

**7. B. On reflection:**

- Are there any other examples in your education that promote or enable partnership working?
- Can you give an example/s?
- How do these compare with the Lund exchange experience?
- Has the experience changed your views or ideas about partnership working with patients or people who use services?

Optional questions / prompts:

- That’s interesting, can you say more?
- Can you give an example?
- Can you give an example of when or how that took place?
- How are you left feeling / thinking about that?
- How often did that happen?
- How strongly did you feel about that?

Tell me more about that?

How did that work?

Was that ever problematic?

In what ways?

Can you explain?

Can you specify / give an example?

Can you describe that?

What happened next?

What was the outcome?

How were you left feeling?

Was that a good thing?

Have we left anything out?

Is there anything you would like to add?

Are there any other thoughts or experiences you would like to add?

- Offer space for reflection before next set of questions.

---

**8. Expectations / on reflection**

- Thank you very much for your help. I have three very short questions to finish with.
- Finally, did you know what to expect from the exchange?
- Were your expectations met?
- Anything else you would like to add or any final impressions?

Optional prompts:

Tell me more about that?

How did that work?

Was that ever problematic?

In what ways?

Can you explain?

Can you specify / give an example?

Can you describe that?

What happened next?

What was the outcome?

How were you left feeling?

Was that a good thing?

Have we left anything out?

Is there anything you would like to add?

Are there any other thoughts or experiences you would like to add?

- Offer space for reflection before next set of questions.

---

**9. Close, thank you, reiterate wish to withdraw consent or data from study, arrange for book voucher to be emailed.**

Stop audio recording.
