Preamble

The requirement for an autogyro to make a successful vertical take off is to apply an overspeed to the rotor. This enables the aircraft to lift off the ground when collective pitch is applied. As the rotor receives no power input the rotor will immediately decelerate and the vertical ascent will halt. The concept is to attain sufficient height to enable the aircraft to convert to forward, horizontal, flight before the rotor speed falls below an acceptable value.

The helicopter is on the ground when the collective pitch is applied. The equations of motion are derived below enabling the rotor speed variation and the aircraft vertical motion to be ascertained.

The assumption is made that the rotor thrust and torque consumption vary with the square of the rotor speed. This requires that the collective pitch remain fixed throughout the motion. It also means that any changes in downwash are ignored.
## Nomenclature

Method

The assumption in the preamble can be expressed:

\[ T \propto \Omega^2 \]
\[ Q \propto \Omega^2 \] (1.)

The equation of vertical motion is-

\[ \ddot{z} = g \left( \frac{T}{W} - 1 \right) \] (2.)

Rotor rotation equation:-
If we define the rotor speed ratio as:

\[
J \dot{\Omega} = -Q_0 \left( \frac{\Omega}{\Omega_0} \right)^2
\]  

(3.)

\[
\bar{\Omega} = \frac{\Omega}{\Omega_0}
\]  

(4.)

\[
T = W \cdot \bar{\Omega}^2
\]  

(5.)

\[
Q = Q_0 \cdot \bar{\Omega}^2
\]  

(6.)

If we define the rotor speed ratio as:

\[
\ddot{z} = g \left( \bar{\Omega}^2 - 1 \right)
\]  

(6.)

We have the following:

Whence:

\[
\frac{d\bar{\Omega}}{dt} = -\frac{Q_0}{J \cdot \Omega_0} \cdot \bar{\Omega}^2
\]  

(7.)

\[
\frac{d\bar{\Omega}}{dt} = -\alpha \cdot \bar{\Omega}^2
\]

And:

\[
\alpha = \frac{Q_0}{J \cdot \Omega_0}
\]  

(8.)

Where:
This equation has the solution:

\[
\frac{1}{\Omega} = \frac{\alpha t + 1}{\Omega_0} \\
\Omega = \frac{1}{k + \alpha t} \\
k = \frac{1}{\Omega_0}
\]  

(9.)

Therefore, (2), (5) & (9) give:

\[
\ddot{z} = \left[ \frac{1}{(k + \alpha t)^2} - 1 \right] g 
\]  

(10.)

From which:

\[
\dot{z} = -g \left[ \frac{1}{\alpha(k + \alpha t)} + t - \frac{1}{k\alpha} \right] \\
= -g \left[ \frac{\Omega}{\alpha} + t - \frac{1}{k\alpha} \right] 
\]  

(11.)

And:
Example

\[
z = -g \left[ \frac{1}{2} t^2 - \frac{t}{k \alpha} + \frac{1}{\alpha^2} \ln \left\{ 1 + \frac{\alpha t}{k} \right\} \right]
\]  \hspace{1cm} (12.)
