
**Celebrating 20 Years of Computers in Mathematics Education: a research bibliography**

Keith Jones

The aim of this *research bibliography* is to celebrate some of the key publications on the use of computers in the teaching and learning of mathematics over the past twenty years (or so). Inevitably this has to be rather selective (and, unfortunately, restricted to publications in English). The aim has been to cover most areas of mathematics and most major applications of technology.

The first section, immediately below, is a chronology of selected key research texts and articles on the use of computers in the teaching and learning of mathematics since 1980:

A mindstorm of a book. Demonstrates how a strong philosophical underpinning can put learners in control of technology. Still a good read and still able to storm minds.

Pioneering classroom study. Full of amazing pupil achievements showing what is possible when learners have some say in what they learn, and have the tools at hand to put their ideas into practice.

A new decade and a new revolution in software - software that allows interaction with mathematical theorems by manipulation with the computer mouse. Read the originators.

Not so much a research study, more a revolutionary approach to designing a “calculator-aware” number curriculum. Those involved will never forget the experience.

Shows what is possible with fairly simple computer tools but a good understanding of what is involved in learning algebra.

Illustrates a range of computer uses in teaching statistics (made possible by a series of studies sponsored by NATO – if only they’d do that again! – not swords to ploughshares, but near enough).

What to do when you have software that allows interaction with mathematical theorems by manipulation with the computer mouse. Advice from the expert!

Classic study demonstrating how judicious use of spreadsheets can lead to algebraic understanding.

The research study that captures a central issue in learning with dynamic geometry software.

Brings together a wealth of research and classroom experience to explain how children develop mathematical meaning through interaction with technological tools.

The 1990s saw the refinement of algebra software and the development of sophisticated hand-held calculators that combine graphic and symbolic capability. This paper develops a sophisticated theoretical model to explain what happens when learners have this form of technology.

Research on the tasks and techniques that help students make the best use of sophisticated hand-held calculators in learning algebra and functions in preparation for calculus.

Not specifically about the teaching and learning of mathematics, more a sobering account of the continuing barriers to widespread use of computers in teaching. Argues “It is premature to call the investment in computers in schools a failure because of lack of evidence for increased productivity and transformed teaching and learning. As the infrastructure matures and teachers’ beliefs about teaching and learning evolve, more and more teachers will change their practices and become serious users of computers in their classrooms”. Read the full text of the book (it’s very readable) online at: http://www.hup.harvard.edu/catalog/CUBOVE.html

An analysis of the style of work that develops when students use computer algebra software in an analytic context.

Another decade and another new technology in the classroom, this time one that might facilitate whole-class interactive learning.

**The second section, again immediately below, is a chronology of useful review articles that capture the developments over the past twenty years (or so):**

Classic review of research on four-function calculators (updated in 1992).

Records that “Anyone who presumes to describe the roles of technology in mathematics education faces challenges akin to describing a newly active volcano – the mathematical mountain is changing before our eyes, with myriad forces operating on it and within it simultaneously.”

Hoyles and Noss observe, “Research in the use of digital technologies has proliferated, using a wide range of theories and methodologies. Whereas it might have been possible a decade or so ago to write a comprehensive review, in just one chapter, of research on the effects of digital technologies on the whole of mathematics teaching and learning, the vast corpus of study that exists now makes this no longer feasible.”

Illustrates how the wealth of research in the use of computers in mathematics education has blossomed so much that it takes two volumes to cover it all!

**MicroMath Research Bibliographies**

Every year hundreds of teachers engage in classroom-based research for a variety of purposes. As more and more opportunities arise for teachers to get support for engaging with research, *MicroMath* is devoting a section to a series of research bibliographies designed to provide details of the most pertinent research on using particular ICT applications in the teaching and learning of mathematics.

**Keith Jones** is a member of the University of Southampton Collaborative Group for Research in Mathematics Education. He leads the thematic group on *Tools and Technologies in Mathematical Didactics* for the European Society for Research in Mathematics Education, see: www.crme.soton.ac.uk
