

# Acknowledgements

First and foremost I would like to thank Professor Greg J Parker for introducing me to the exciting field of photonics and for proposing the study presented in this thesis. Through him I have been able to meet and collaborate with a large group of excellent scientists, whose experience has been fundamental to the success of my project.

The support and collaboration of Ken E Frampton, Mark R Long, Andy J Sellwood and Eric G Webb at the ECS Mechanical Workshop of the University of Southampton, in constructing a great piece of experimental equipment has been very useful and amusing.

I owe special thanks to Dr M Caterina Netti, for her invaluable assistance in matters of experimental optics and for her friendship, to Dr Martin DB Charlton, for his very extensive knowledge in the field of photonic crystals and for his e-beam sorceries, to Dr Majd E Zoorob, for his generosity in assisting me in computational matters, and to Professor Jeremy J Baumberg, for giving me the opportunity to carry out experimentation in his ultrafast laser lab and all the excitement that ensued.

I am grateful to Walter Belardi and Professor David J Richardson at ORC, University of Southampton for generously offering a piece of their excellent photonic crystal fibre, which has been central to my research. I also would like to thank another member of ORC, Dr Richard Williams, for assisting me with the ellipsometry.

I wish to thank Dr Peter Vukusic at Exeter University for supplying the first *Morpho rhetenor* wing sample.

Many thanks to Dr Michael Kraft for the constructive discussions about the contents of this thesis.

Finally, I would like to thank the University of Southampton, the swiss authorities of the Ufficio Borse di Studio, Cantone Ticino, the Sunburst Fonds at ETH Zurich, for funding me. A dear thought goes to Professor Henry Baltes at PEL, ETH Zurich and Professor Oliver Paul at IMTEK, University of Freiburg for supporting my funding applications.
