Received 9 December 2011; accepted 9 December 2011

 Key indicators: single-crystal X-ray study; $T = 120$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.040; wR factor = 0.103; data-to-parameter ratio = 18.1.

In the title compound, $\text{C}_{19}\text{H}_{15}\text{Cl}_2\text{N}_3\text{O}_2$, the benzotriazole ring system is approximately planar [maximum deviation = 0.018 (2) Å] and its mean plane is oriented at dihedral angles of 30.70 (5) and 87.38 (4)°, respectively, to the furan and benzene rings while the dihedral angle between furan and benzene rings is 74.46 (6)°. In the crystal, weak $\text{C}-\text{H}\cdots\text{N}$ hydrogen bonds link the molecules into chains along the b axis. $\pi-\pi$ stacking interactions between the parallel dichlorobenzene rings of adjacent molecules [centroid-centroid distance = 3.6847 (9) Å] and weak $\text{C}-\text{H}\cdots\pi$ interactions are also observed.

1-[2-(2,4-Dichlorobenzoyloxy)-2-(furan-2-yl)ethyl]-1*H*-benzotriazole

Ö. Özel Güven, M. Bayraktar, S. J. Coles and T. Hökelek

Comment

In recent years, there has been increasing interest in syntheses of heterocyclic compounds that have biological and commercial importance. Miconazole and econazole have been developed for clinical uses as antifungal agents. Similar structures containing benzimidazole ring in place of imidazole ring of miconazole and econazole have been reported showing more antibacterial activity than antifungal activity (Özel Güven *et al.*, 2007*a,b*). Benzotriazole derivatives also exhibit a good degree of analgesic, anti-inflammatory, diuretic, antiviral and antihypertensive activities (Hirokawa *et al.*, 1998; Yu *et al.*, 2003; Kopanska *et al.*, 2004). The crystal structures of miconazole (Peeters *et al.*, 1979), econazole (Freer *et al.*, 1986) and similar ether compounds (Özel Güven *et al.*, 2008; Özel Güven *et al.*, 2009; Özel Güven *et al.*, 2010*a,b*; Özel Güven *et al.*, 2011) have been reported, previously. Now, we report herein the crystal structure of a new benzotriazole derivative, (I).

In the molecule of the title compound (Fig. 1), the bond lengths and angles are generally within normal ranges. The benzotriazole [B (N1-N3/C7-C12)] ring system is approximately planar with a maximum deviation of 0.018 (2) Å for atom C9 and its mean plane is oriented with respect to the furan [A (O2/C2-C5)] and benzene [C (C14-C19)] rings at dihedral angles of A/B = 30.70 (5) and B/C = 87.38 (4)°. The dihedral angle between furan and benzene rings is A/C = 74.46 (6)°. Atom C6 is -0.033 (2) Å away from the plane of the benzotriazole ring and atom C1 is 0.050 (2) Å away from the plane of the furan ring, while atoms C11, C12, O1 and C13 are 0.0309 (5), 0.0223 (5), 0.0817 (11) and 0.0195 (18) Å away from the plane of the benzene ring, respectively.

In the crystal, weak C—H···N hydrogen bonds (Table 1) link the molecules into chains along the b-axis (Fig. 2). There also exists a π – π contact between the benzene rings, Cg4—Cg4ⁱ, may further stabilize the structure [centroid-centroid distance = 3.685 (1) Å; symmetry code: (i) 2 - x, -y, -z; Cg4 is the centroid of the ring C (C14-C19)]. A weak C—H··· π interaction (Table 1) may stabilize the structure.

Experimental

The title compound, (I), was synthesized by the reaction of 2-(1*H*-benzotriazol-1-yl)-1-(furan-2-yl)ethanol (Özel Güven *et al.*, 2012) with aryl halide using NaH. 2-(1*H*-Benzotriazol-1-yl)-1-(furan-2-yl)ethanol (219 mg, 0.95 mmol) was dissolved in DMF (4 ml). NaH (38 mg, 0.96 mmol) was added to the solution portionwise. After stirring the mixture a few minutes, 2,4-dichlorobenzyl bromide (229 mg, 0.95 mmol) was added dropwise. Then, the reaction mixture was stirred additional 3 h at room temperature. Adding methanol (5 ml), the reaction was stopped. After evaporation of the solvent, dichloromethane was added to the reaction mixture and extracted with water. Then, the organic phase was separated, dried, filtered and evaporated. The precipitate formed was purified by column chromatography using chloroform and crystallized from 2-propanol to obtain colorless crystals suitable for X-ray analysis (yield; 295 mg, 80%).

Refinement

H atoms were positioned geometrically with C—H = 0.98, 0.93 and 0.97 Å for methine, aromatic and methylene H, respectively, and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$.

Figures

Fig. 1. The molecular structure of the title compound with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

Fig. 2. A partial packing diagram. Hydrogen bonds are shown as dashed lines. Hydrogen atoms not involved in hydrogen bonding have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.103$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0497P)^2 + 0.507P]$
4251 reflections	where $P = (F_o^2 + 2F_c^2)/3$
235 parameters	$(\Delta/\sigma)_{\max} < 0.001$
0 restraints	$\Delta\rho_{\max} = 0.23 \text{ e } \text{\AA}^{-3}$
	$\Delta\rho_{\min} = -0.34 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R- factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg is the centroid of the C14–C19 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
$C4-H4\cdots N3^i$	0.93	2.59	3.452 (2)	155
$C8-H8\cdots Cg^{ii}$	0.93	2.92	3.782 (2)	155

Symmetry codes: (i) $-x+1, y+1/2, -z+1/2$; (ii) $-x+2, -y, -z+1$.
