Doctor of Philosophy<br>The total synthesis of colombiasin A t-butyl ether

by Heather Opal Bourne

This thesis is concerned with the synthesis of (-)-colombiasin A, a natural product with reported anti-tubercular activity, recently isolated from the Carribean sea whip Pseudopterogorgia elisabethae. This thesis describes a new approach to (+)- and (-)colombiasin A tert-butyl ether from (+)- and (-)-dihydrocarvone respectively. Key features are a one-pot Shapiro reaction; an asymmetric hydroboration-oxidation reaction and an elaborate "reagent free" cascade sequence. The latter involves sequential thermal rearrangement of a cyclobutenone to a hydroquinone, aerial oxidation to a quinone and an intramolecular Diels-Alder cycloaddition.
Since its isolation, two syntheses of (-)-colombiasin A and two further approaches have been reported, all of which are reviewed in detail in Chapter I. Model studies on the Shapiro reaction and the thermal rearrangement of the resulting cyclobutenones are described in detail in Chapter II.

Studies leading to the elaboration of a diene side-chain on ( + )-dihydrocarvone are featured in Chapter III. Key reactions are an asymmetric hydroboration step, which proceeds with good diastereoselectivity and an extremely efficient Kocieński-Julia coupling which provides an appealing alternative to a Wittig reaction.

In Chapter IV, routes to ( + )- and (-)-colombiasin A tert-butyl ether are described. These sequences implement the findings of our preliminary studies together with an intramolecular Diels-Alder cycloaddition to complete the syntheses.
Experimental procedures are outlined in Chapter V.

## Table of Contents

Preface ..... i
Acknowledgements ..... ii
List of abbreviations ..... iv
CHAPTER I: INTRODUCTION TO COLOMBIASIN A ..... 1-17
I. 1 - Pseudopterogorgia Elisabethae - a source of biologically active metabolites ..... 1
i. The Pseudopterosins ..... 1
ii. Anti-tubercular metabolites ..... 2
a) Benzoxazole alkaloids ..... 2
b) Novel lactones ..... 3
c) Cumbiasins ..... 3
d) Other diterpenes ..... 3
e) Colombiasin A ..... 4
I. 2 - Proposed biosynthesis ..... 5
i. $p$-Benzoquinone 1.11 as a biosynthetic precursor ..... 6
ii. Elisabethin A 1.12 as a biosynthetic precursor ..... 6
I. 3 - Previous syntheses ..... 7
i. The Nicolaou total synthesis of (-)-Colombiasin A ..... 7
ii. The Harrowven approach ..... 10
iii. The Rychnovsky synthesis of (-)-colombiasin A ..... 12
iv. The Flynn approach ..... 14
I. 4 - Retrosynthesis ..... 16
CHAPTER II - MODEL STUDIES I ..... 18-32
II.1-Vinyllithium ..... 19
i. via The Shapiro reaction ..... 19
a) Tosyl hydrazone ..... 19
b) Trisyl hydrazone ..... 20
c) One-pot Shapiro ..... 23
ii. via Vinyl iodides ..... 25
a) Hydrazones ..... 25
b) Vinyl phosphonates ..... 26
c) Vinyl stannanes ..... 27
II. 2 - Squarate ..... 29
i. Methyl squarate ..... 29
ii. tert-Butyl squarate ..... 30
II. 3 - Rearrangement and oxidation ..... 31
CHAPTER III - MODEL STUDIES II ..... 33-49
III. 1 - Boron chemistry ..... 33
i. Suzuki coupling ..... 33
ii. Nucleophilic displacement ..... 35

## Preface

The research described in this thesis was carried out under the supervision of Dr. D. C. Harrowven at the University of Southampton between October 2000 and October 2003. No part of this thesis has previously been submitted for a degree.

## Acknowledgements

My first BIG thank you has to go to David Harrowven for giving me the opportunity to join his group. Thanks for the immense patience you have shown during the past 3 years, for always having a positive comment and for the support in times of near desperation. Thanks for the laughs, the drinks, the proof-reading and the columns/recrysts!! Thank you thank you thank you thank you. $\qquad$

My second BIG thank you has to go to all those who were there, day in, day out, sharing the joys and pains of the lab. You all know who you are! In particular, I'd like to thank Pete for his advice which I (regrettably?) never took; Melly for making me laugh and giving me the opportunity to exert my tongue muscle; Mike, for all the advice and patience; Matpeu, for great parties and sharing good musical taste; Stu for the tomatoes and cream and introducing me to the delights of "Heat"; Tim for always being up for going through the alphabet, any day of the week, for his appreciation of Margaritas and for his friendship; Hian for the air guitar duets and Geoff for his white russians and for being a good friend. You've made it all worth it!!
Colleen, Lucy and Tim thanks for giving me a place to stay in the last few months. My appreciation also goes to Daniela and Dave P. for sharing the delights of this project. Good luck!!

Thirdly, a few special people deserve a mention. Bine, you've been a great listener and "cheerer-up" on top of being a great Fencheltee maker. Thanks for everything. Dr. Nellie, thanks for the laughs over the past 8 years. We can now both happily say that "we've made it!!!!!". A telepathic huge thank you has to go to Louis for being "there" despite the thousands of miles between us and for sharing an understanding of the Soul of the World. Sibel, Nat, Virginie and Kylie thanks for all the moral support and for still being great friends after 15 odd years.

My appreciation goes to Neil Wells and Joan Street for the NMR service provided; to John Langley and Julie Herniman for MS; to all in the X-ray suite; to Dr. Martin Grossel for his advice and to Dr. Jeremy Hinks for being a great pedagogue. A
special thank you goes to Jill Queen and Sue Pipe for always having a smile and good words of comfort. Tim, Geoff, Hian and Dave, thanks for the proofreading and Neil thanks for your help in piecing this work of art together!

Finally, words could never convey the love and appreciation I have for my family. I'll try anyway... Papa, thank you for all the words of wisdom throughout the years; Mamita, thank you for the never-ending encouragement; Juju, thanks for the comforting and Debsipoos, thanks for always putting a smile on my face. Grogro, Tonton Pierre and Marie thank you for your financial help and for being there in your own special way. To all of you, I have to say thank you for believing in me and always being there for me. I could never have done this without you.

## CHAPTER I - INTRODUCTION

## I. 1 - Pseudopterogorgia Elisabethae - a source of biologically active metabolites

Since the 1970s, Pseudopterogorgia elisabethae, a gorgonian octocoral found in the Caribbean Sea, has attracted increasing interest from natural product chemists. This coral has indeed proved to be a rich source of biologically active secondary metabolites, many having intriguing structural features. ${ }^{1-5}$

## i. The Pseudopterosins

Amongst these natural products, a predominant class of diterpenes, namely the pseudopterosins, have been the subject of a number of creative total syntheses, ${ }^{6}$ due to their strong anti-inflammatory and analgesic properties. ${ }^{7}$ Pseudopterosin C , in particular, has found commercial application as the active component of a topical skin cream, "Resilience ${ }^{\circledR}$ ". ${ }^{8}$

(Pseudopterosin C, $\mathrm{R}_{1}=\mathrm{R}_{3}=\mathrm{H}, \mathrm{R}_{2}=\mathrm{Ac}$ )

## ii. Anti-tubercular metabolites

In the last 5 years, ongoing investigation on the marine organism has led to the isolation of a plethora of previously undescribed compounds with activities ranging from anti-inflammatory, ${ }^{9}$ anti-tumour, ${ }^{10-12}$ to anti-malarial activity. ${ }^{13}$

Most significantly however, the antimycobacterial activity observed during the screening of hexane extracts from Pseudopterogorgia elisabethae for growth inhibition of Mycobacterium tuberculosis $\mathrm{H}_{37} \mathrm{Rv}$, the agent that causes tuberculosis, has led to the isolation and characterisation of a number of potential antitubercular leads.

## a) Benzoxazole alkaloids

Amongst these, the isolation of benzoxazole alkaloids is noteworthy due to the extreme rarity of such structures in marine biota. Pseudopteroxazole 1.1 and secopseudopteroxazole 1.2 were isolated in 1999 and exhibited potent inhibitory activity ( $97 \%$ and $66 \%$ respectively) against Mycobacterium tuberculosis $\mathrm{H}_{37} \mathrm{Rv}$ at a concentration of $12.5 \mu \mathrm{~g} \cdot \mathrm{~mL}^{-1} .{ }^{14}$ Isolated more recently, homopseudopteroxazole 1.3 was found to possess similar antitubercular activity. ${ }^{15}$

1.1

1.2

1.3
b) Novel lactones

A number of active diterpenes with intricate carbocyclic skeletons were also identified. For instance, lactones elisabetholide 1.4 and amphilectolide 1.5 are the first examples of such structural classes. ${ }^{16}$ Amphilectolide 1.5 induced $42 \%$ growth inhibition at a concentration of $6.25 \mu \mathrm{~g} . \mathrm{mL}^{-1}$.

1.4

1.5

## c) Cumbiasins

The cumbiasins (1.6 A, 1.6 B, and 1.6 C), although moderately active ( $17 \%$ growth inhibition), possess an unusual architecture which probably results from a series of rearrangements on a serrulatane diterpene precursor. ${ }^{12}$

Cumbiasin A 1.6 A ( $\mathrm{R}=\mathrm{H}$ )
Cumbiasin B 1.6 B ( $\mathrm{R}=\mathrm{OH}$ )

Cumbiasin C 1.6 C

## d) Other diterpenes

Two serrulatane-based diterpenes, erogorgiaene 1.7 and 7-hydroxyerogorgiaene 1.8 and a novel bis-diterpene, bis-hydroxyerogorgiaene 1.9 , were also identified as strong inhibitors of Mycobacterium tuberculosis $\mathrm{H}_{37} \mathrm{Rv}^{17}$

erogorgiaene $(\mathrm{R}=\mathrm{H}) \mathbf{1 . 7}$
7-hydroxyerogorgiaene $(\mathrm{R}=\mathrm{OH}) 1.8$

bis-7-hydroxyerogorgiaene 1.9

## e) Colombiasin A

As synthetic chemists, we were particularly interested in an active secondary metabolite, (-)-colombiasin A 1.10, which after extensive structure elucidation was found to belong to a previously undescribed class of $\mathrm{C}_{20}$ rearranged diterpenes. ${ }^{18}$ Indeed, (-)-colombiasin A 1.10 is a complex tetracycle consisting of a 'propellane' arrangement of three six-membered rings to which is further fused a cyclopentane ring. This natural product also contains six stereogenic centres, two of which are quarternary and one of which is common to all four rings, adding to the synthetic challenge posed by this molecule.

(-)-Colombiasin A
1.10

colombiane skeleton

The absolute configuration of colombiasin A was not assigned until Nicolaou et al. compared data of the synthetic material with the natural sample. ${ }^{19}$ It was established to be $1 S, 2 S, 3 S, 6 R, 7 S, 9 S$.

## I. 2 Proposed biosynthesis

It can be noted that all the metabolites described above belong to structurally similar classes of diterpenes. Their concomitance in Pseusopterogorgia Elisabethae strongly suggests that, in vivo, a serrulatane diterpene is the biosynthetic precursor to many of these structurally novel diterpenes (Scheme 1.1). ${ }^{20}$

serrulatane

amphilectane

elisabethane

Scheme 1.1

## i. p-Benzoquinone $\mathbf{1 . 1 1}$ as a biosynthetic precursor

Similarly, the colombiane skeleton could result from a series of rearrangements on a serrulatane precursor. For instance, elimination of the C15 hydroxy group of the serrulatane diterpene $p$-benzoquinone $1.11,{ }^{4}$ followed by an intramolecular cyclisation would yield colombiasin A (Scheme 1.2).

Colombiasin A
1.10
$p$-benzoquinone
1.11

Scheme 1.2

## ii. Elisabethin A 1.12 as a biosynthetic precursor

Alternatively, hydroxylation of elisabethin A 1.12, a metabolite also isolated from Pseudopterogorgia elisabethae, ${ }^{20}$ at the C12 position followed by phosphorylation or protonation of the new oxygen, base-catalysed removal of the proton at C 2 and intramolecular alkylation of the resulting enolate could furnish colombiasin A $\mathbf{1 . 1 0}$ (Scheme 1.3). ${ }^{18}$

Scheme 1.3

From a synthetic point of view, the biosynthetic pathway involving a serrulatane diterpene precursor (Scheme 1.2), has provided inspiration for all reported synthetic strategies towards this natural product. These are discussed in detail below.

## I. 3 Previous syntheses

## i. The Nicolaou total synthesis of (-)-colombiasin A

In 2001, Nicolaou et al. ${ }^{19}$ published the first total synthesis of colombiasin A. Two key Diels-Alder reactions are the main features of the synthesis. Firstly, formation of the bicyclic precursor $\mathbf{1 . 1 5}$ is achieved by a cycloaddition reaction between diene 1.13 and quinone 1.14. More interestingly however a key intramolecular DielsAlder reaction in the latter stages of the synthesis effects closure of the colombiane skeleton (Scheme 1.4).
In the early stages, diene $\mathbf{1 . 1 3}$ was fused to quinone $\mathbf{1 . 1 4}$ (obtained by orthomethylation of 1,2,4-trimethoxybenzene followed by oxidative demethylation using AgO and $\mathrm{HNO}_{3}$ ) at ambient temperature in ethanol to give the endo-cycloadduct 1.15. Conversion of the silyl enol ether $\mathbf{1 . 1 5}$ to the corresponding ketone $\mathbf{1 . 1 7}$ using TFA required prior aromatisation of 1.15 to 1.16 with $\mathrm{K}_{2} \mathrm{CO}_{3}$ and MeOH . Alkylation of the bicyclic ketone $\mathbf{1 . 1 7}$ failed to proceed by "standard methods" and
instead, a Pd catalysed sigmatropic rearrangement of carbamate 1.18 successfully installed the side-chain at the C6 position. The stereochemistry of the C7 methyl group however was opposite to that required. Inversion of the C7 centre was achieved by ozonolysis of alkene ( $\mathbf{7 R} \boldsymbol{R} \mathbf{- 1 . 2 0}$ followed by epimerisation of the resulting aldehyde with NaOMe in MeOH . A Wittig reaction converted the aldehyde to alkene (7S)-1.20. Hydroboration-oxidation of alkene (7S)-1.20, oxidation of the resulting alcohol to aldehyde $\mathbf{1 . 2 1}$ and olefination using phosphonium ylid $\mathbf{1 . 2 6}$ yielded the key diene intermediate $\mathbf{1 . 2 2}$. Protection of the diene moiety as the cyclic sulfone and subsequent oxidative demethylation furnished quinone 1.23. Heating quinone $\mathbf{1 . 2 3}$ to $180^{\circ} \mathrm{C}$ resulted in $\mathrm{SO}_{2}$ extrusion and the key intramolecular [4+2] cycloaddition of the diene to the quinone proceeded exclusively via an endo transition state to give the colombiane skeleton $\mathbf{1 . 2 4}$ in $89 \%$ yield. Shielding from light was necessary for this key step to proceed successfully as a competing [2+2] cycloaddition was observed. Dehydroxylation at the C5 centre was achieved by formation of the xanthate followed by reductive cleavage of the $\mathrm{C}-\mathrm{O}$ bond with tributyltin hydride. Attempts at deprotecting the resulting quinone 1.25 with $\mathrm{BBr}_{3}$ partially resulted in partial isomerisation of the C10-C11 double bond to the C11-C12 position. Nevertheless, the deprotected product was observed in $30 \%$ yield and this step concluded the first racemic total synthesis of colombiasin A. In the asymmetric series, the use of a chiral catalyst $\left[(S)-\mathrm{BINOLTiCl}_{2}\right]$ in the first Diels-Alder cycloaddition reaction resulted in asymmetric induction ( $94 \%$ ee) and the chemistry elaborated in the racemic series was then applied to give (-)-colombiasin A $\mathbf{1 . 1 0}$ in an overall $0.8 \%$ yield.

Reagents/Conditions: i) $\mathrm{EtOH}, 25^{\circ} \mathrm{C}, 2 \mathrm{~h}, 83 \%$; ii) $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( 5 eq.), MeI (20 eq.), acetone, reflux, $48 \mathrm{~h}, 83 \%$; iii) $2 \% \mathrm{TFA}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 25^{\circ} \mathrm{C}, 2 \mathrm{~h}, 91 \%$; iv) LiHDMS ( 1.2 eq.), THF, $-78{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$, then crotyl chloroformate ( 1.4 eq .), $25^{\circ} \mathrm{C}, 30 \mathrm{~min}, 94 \%$; v) $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]\left(0.04 \mathrm{eq}\right.$.), THF, $25^{\circ} \mathrm{C}, 15 \mathrm{~min}$, $58 \%$; vi) $\mathrm{NaBH}_{4}$ ( 3 eq.), $\mathrm{MeOH}, 25^{\circ} \mathrm{C}, 30 \mathrm{~min}, 96 \%$; vii) $\mathrm{Et}_{3} \mathrm{~N}$ (2 eq.), $\operatorname{TBSOTf}$ ( 1.2 eq.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-$ $78^{\circ} \mathrm{C}, \mathrm{lh}, 95 \%$; viii) $\mathrm{OsO}_{4}$ ( 0.05 eq.), NMO (2 eq.), acetone $/ \mathrm{H}_{2} \mathrm{O}$ ( $10 / 1$ ), $25^{\circ} \mathrm{C}, 5 \mathrm{~h}, 89 \%$; ix) $\mathrm{NaIO}_{4}$ on silica gel, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 25^{\circ} \mathrm{C}, 30 \mathrm{~min}, 82 \%$; x) NaOMe ( 4 eq.), MeOH/THF ( $2 / \mathrm{l}$ ), $25^{\circ} \mathrm{C}, 12 \mathrm{~h}, 30 \%$; xi) methyltriphenylphosphonium bromide ( 1.2 eq .), $\mathrm{KO}^{\prime} \mathrm{Bu}\left(1.4 \mathrm{eq}\right.$.), THF, $25^{\circ} \mathrm{C}$, 1 h then $\mathbf{7 S - 1 . 2 0}$ ( $\mathrm{R}=\mathrm{O}$ ), $25^{\circ} \mathrm{C}, 30 \mathrm{~min}, 97 \%$; xii) $\mathrm{BH}_{3}$. ## Scheme 1.4

Although lengthy, this first route to (-)-colombiasin A has allowed the determination of the natural product's absolute configuration, as well as the construction of a variety of chemical analogues for possible biological studies. However, installation of the correct configuration at the C7 centre proved cumbersome, and the problems encountered in the last deprotection step suggest that there is still room for improvement.

## ii. The Harrowven approach

Shortly after publication of the work of Nicolaou, Harrowven et al. ${ }^{21}$ reported an approach to epi-colombiasin A methyl ether 1.39 (Scheme 1.5). Similarly, a key intramolecular cycloaddition on 1.38 effects closure of the colombiane framework. However, construction of the bicyclic framework relies on a new arene alkylation method.
The starting point of the synthetic sequence was the synthesis of phenol 1.28 from 2,6-dimethoxytoluene 1.27. A Vilsmeier reaction on $\mathbf{1 . 2 7}$ followed by treatment with $m$ CPBA furnished phenol 1.28 in good yield after basic cleavage. A Pechman condensation with ethyl acetoacetate then gave coumarin 1.29. Hydrogenation of alkene 1.29 and saponification of the lactone led to ester $\mathbf{1 . 3 0}$. Conversion to the corresponding aldehyde 1.31 and treatment with phosphonate 1.32 yielded alkene 1.33. On treatment with triflic acid, 1.33 underwent an aromatic alkylation to give spirolactone 1.34 , thus furnishing the bicyclic core. Unfortunately, opening of the spirolactone using catalytic hydrogenolysis installed the inverse stereochemistry at the C6 centre.
Elaboration of the side-chain was achieved by converting ester 1.35 to aldehyde 1.36. A Wittig reaction then gave diene 1.37 which was protected as the cyclic sulfone in order to achieve oxidative demethylation of the arene. Heating quinone 1.38 in the dark yielded epi-colombiasin A methyl ether 1.39 in $0.6 \%$ overall yield. The inverse stereochemistry at the C6 centre has yet to be addressed. Nonetheless, this route represents an improvement in terms of length and features some interesting chemical transformations. The sequence of arene-alkylation and opening of the spirocycle by tandem hydrogenation-hydrogenolysis is particularly
noteworthy as it unveils the bicyclic core and installs the side-chain in just a few steps.

Reagents/Conditions: i) $\mathrm{POCl}_{3}, \mathrm{DMF}, 2 \mathrm{~h}, 105{ }^{\circ} \mathrm{C}, 68 \%$; ii) $m \mathrm{CPBA}, \mathrm{DCM}$, reflux then KOH , $\mathrm{MeOH}, 1 \mathrm{~h}, \mathrm{RT}, 96 \%$; iii) ethyl acetoacetate, TfOH, $3 \mathrm{~h}, 70^{\circ} \mathrm{C}, 60 \%$; iv) $\mathrm{H}_{2}, \mathrm{Pd}-\mathrm{C}, \mathrm{EtOAc}, 96 \mathrm{~h}, \mathrm{RT}$, $98 \%$; v) $\mathrm{Me}_{2} \mathrm{SO}_{4}, \mathrm{KOH}$, acetone, $16 \mathrm{~h}, 89 \%$; vi) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 40 \mathrm{~min},-78{ }^{\circ} \mathrm{C}$ to $0{ }^{\circ} \mathrm{C}, 99 \%$; vii) DMP, DCM, $30 \mathrm{~min}, 0^{\circ} \mathrm{C}, 96 \%$; viii) KO ${ }^{\prime} \mathrm{Bu}, \mathrm{THF}, 24 \mathrm{~h}, 0^{\circ} \mathrm{C}$ to $\mathrm{RT}, 62 \%$; ix) $\mathrm{TfOH}, \mathrm{PhMe}, 72 \mathrm{~h}, 80$ ${ }^{\circ} \mathrm{C}, 59 \%$; x) $\mathrm{H}_{2}, \mathrm{Pd}-\mathrm{C}, \mathrm{PtO}_{2}, \mathrm{AcCl}, \mathrm{MeOH}, 48 \mathrm{~h}, \mathrm{RT}, 85 \%$; xi) $\mathrm{LiAlH}_{4}, \mathrm{THF}, 20 \mathrm{~min},-78{ }^{\circ} \mathrm{C}$ to $0{ }^{\circ} \mathrm{C}$, $99 \%$; xii) DMP, DCM, $30 \mathrm{~min}, 0^{\circ} \mathrm{C}, 99 \%$; xiii) phosphorane $1.26, \mathrm{THF}, 40 \mathrm{~min}, 0{ }^{\circ} \mathrm{C}$ to $\mathrm{RT}, 60 \%$; xiv) liquified $\mathrm{SO}_{2}, 4 \mathrm{~h},-78{ }^{\circ} \mathrm{C}$ to $\mathrm{RT}, 71 \%$; xv) $\mathrm{AgO}, \mathrm{HNO}_{3}$, dioxane, $5 \mathrm{~min}, \mathrm{RT}, 25 \%$; xvi) toluene, sealed tube, dark, $7 \mathrm{~h}, 180^{\circ} \mathrm{C}, 64 \%$.

## iii. The Rychnovsky synthesis of (-)-colombiasin A

More recently, Rychnovsky et al. ${ }^{22}$ published work on the synthesis of elisapterosin B 1.51 and colombiasin A 1.10 using, in both cases, the same serrulatane diterpene precursor 1.50. In fact, a [5+2] intramolecular cycloaddition of $\mathbf{1 . 5 0}$ leads to the elisapterosin skeleton 1.51 , whereas a [4+2] cycloaddition yields the colombiane skeleton $\mathbf{1 . 1 0}$.
Starting with Myers' pseudoephedrine chiral auxiliary 1.40, ${ }^{23}$ enantiomerically pure aldehyde 1.41 was obtained by a sequence of alkylation, reduction and hydrolysis. Wittig olefination next furnished ester 1.42. Elaboration of ester 1.42 into diene 1.43 was achieved by homologation to the lithium ynolate using bromomethylenelithium followed by butyllithium. Treatment with lithium hydride and subsequent acetylation yielded diene 1.43 in $79 \%$ yield. Union of diene 1.43 with quinone 1.44 by a lithium perchlorate promoted Diels-Alder reaction yielded decalin 1.46 as the major product. Reduction of enedione 1.46 with $\mathrm{NaBH}_{4}$ prevented aromatisation and the acetate group could then be easily substituted with a methyl group using lithium dimethylcuprate. Reduction of the C4-C5 alkene of 1.47 with hydrogen, oxidation and treatment with DBU furnished quinone 1.48 which was protected as the acetylated arene 1.49. Elaboration of the side-chain was then achieved by TIPS deprotection, oxidation and olefination using phosphonium ylid 1.26 to furnish the serrulatane diterpene $\mathbf{1 . 5 0} . \mathrm{BF}_{3} . \mathrm{OEt}_{2}$ ( 25 fold excess) was found to induce the [5+2] cycloaddition whereas thermal conditions in the absence of light gave the $[4+2]$ cycloaddition product i.e. ( - )-colombiasin A methyl ether $1.25(\mathrm{R}=\mathrm{Me})$. Deprotection with $\mathrm{AlCl}_{3}$ completed the synthesis of $(-)$-colombiasin A $1.10(R=H)$ in 17 steps and a 3.9\% overall yield (Scheme 1.6).
Rychnovsky's ingenious use of a Diels-Alder cycloaddition to construct the key intermediate 1.46 in an asymmetric fashion lends all merit to this sequence. Also, elaboration of quinone 1.48 into an intermediate that can provide both natural products by fine-tuning of reaction conditions is remarkable. However, the stereocontrol observed in the synthesis of $\mathbf{1 . 4 6}$ is quite poor (1.7:1) and this is carried out through the synthesis yielding both natural products as an inseparable mixture of diastereomers.

Reagents/Conditions: i) $\mathrm{LDA}, \mathrm{LiCl}, \mathrm{ICH}_{2} \mathrm{CH}_{2} \mathrm{OTIPS}, 94 \%,>97 \%$ de; ii) $\mathrm{LiAlH}\left(\mathrm{OEt}_{3}\right)$, then $\mathrm{H}^{+}$, $77 \%$; iii) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCO}_{2} \mathrm{Me}, \mathrm{CH}_{3} \mathrm{CN}$, reflux, $85 \%$; iv) $\mathrm{LiCH}_{2} \mathrm{Br}, \mathrm{THF},-78^{\circ} \mathrm{C}$; v) $n \mathrm{BuLi},-78{ }^{\circ} \mathrm{C}$ to 23 ${ }^{\circ} \mathrm{C}$; vi) LiH , reflux; vii) $\mathrm{Ac}_{2} \mathrm{O}, 79 \%$; viii) $5 \mathrm{M} \mathrm{LiClO}_{4}, \mathrm{Et}_{2} \mathrm{O}, 24 \mathrm{~h}, 75 \%$; ix) $\mathrm{NaBH}_{4}, \mathrm{CeCl}_{3}, \mathrm{MeOH}$, $93 \%$; x) $\mathrm{LiCuMe}_{2}, \mathrm{Et}_{2} \mathrm{O}, 0{ }^{\circ} \mathrm{C}$ to $23^{\circ} \mathrm{C}, 83 \%$; xi) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{EtOH}, 95 \%$; xii) Dess-Martin periodinane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 92 \%$; xiii) $\mathrm{DBU}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, air, $70 \%$; xiv) $\mathrm{Zn}, \mathrm{Ac}_{2} \mathrm{O}, \mathrm{NaOAc}$, then $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, $96 \%$; xv) HF-pyridine, THF, $94 \%$; xvi) Dess-Martin periodinane, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 99 \%$; xv) phosphorane $1.26, \mathrm{THF}, 78 \%, 3: 1 \mathrm{E} / \mathrm{Z}$; xvi) $\mathrm{K}_{2} \mathrm{CO}_{3}, \mathrm{MeOH}$, air, $79 \%$; xvii) $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$ ( 25 eq.), $\mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}, 41 \%$; xviii) $180^{\circ} \mathrm{C}$, toluene, $83 \%$; xix) $\mathrm{AlCl}_{3}, \mathrm{PhNMe}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}$ to $23^{\circ} \mathrm{C}, 73 \%$.

Most recently, Flynn et al. ${ }^{24}$ have demonstrated that the tetracyclic core of colombiasin A could be accessed by a tandem Diels-Alder-eliminationintramolecular Diels-Alder (DA-E-IMDA) sequence. The method relies on the synthesis of a tetraene 1.54 , which can be fused to a sulfoxide dienophile 1.55 by a Diels-Alder reaction. Sulfoxide elimination ensues and a subsequent intramolecular Diels-Alder reaction on $\mathbf{1 . 5 6}$ effects the cyclisation to the colombiane skeleton $\mathbf{1 . 5 7}$ (Scheme 1.7).

Reagents/Conditions: i) HCl (aq.); ii) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHC}(\mathrm{O}) \mathrm{CH}_{3}$; iii) $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}_{2}$ (2 eq.); iv) $\mathrm{CH}_{2} \mathrm{Cl}_{2},-15^{\circ} \mathrm{C}$ to $18^{\circ} \mathrm{C}$; v) toluene, $160^{\circ} \mathrm{C}$.

## Scheme 1.7

Flynn also demonstrated the viability of this method as an asymmetric route to the colombiasin A core by using unichiral sulfinylquinone 1.61 as the dienophile. Bromophenol 1.58 (accessed from 2,6 dimethoxytoluene) can be lithiated and reaction with ( $S, S$ )-menthyl $p$-toluenesulfinate 1.59 yields, upon subsequent CAN oxidation, chiral sulfinylquinone 1.61. Sulfinylquinone $\mathbf{1 . 6 1}$ undergoes a cycloaddition with tetraene 1.62 which, after elimination gives diene 1.63 with
excellent enantioselectivity (ee 94:6). Quinone $\mathbf{1 . 6 3}$ can then undergo an intramolecular cycloaddition to give the endo-adduct 1.64 (Scheme 1.8).

1.64

Reagents/Conditions: i) $n \mathrm{BuLi}$ (2 eq.), THF, $-78^{\circ} \mathrm{C}$ then 1.59 ; ii) ammonium cerium(IV) nitrate, $\mathrm{CH}_{3} \mathrm{CN}, 18{ }^{\circ} \mathrm{C}$; iii) $\mathrm{CH}_{2} \mathrm{Cl}_{2},-15^{\circ} \mathrm{C}$ to $18{ }^{\circ} \mathrm{C}$; iv) toluene, $160^{\circ} \mathrm{C}$.

Scheme 1.8

Although access to the natural product has yet to be achieved, the Flynn approach provides a rapid, asymmetric route to the colombiane skeleton.

It can be noted that in all the reported syntheses of colombiasin A, a similar strategy is being used. In the primary stages, a bicyclic core is constructed, in most cases by means of a Diels-Alder reaction. Elaboration of a diene side-chain ensues and the resulting "serrulatane-type" structure is subjected to heat to induce an intramolecular cycloaddition. Optical purity is achieved by the use of chiral auxiliaries in the early stages of the syntheses.

## I.4 Retrosynthesis

Our retrosynthesis relies on the previously described intramolecular Diels-Alder reaction to effect closure of the tetracycle. We envisioned that key intermediate 1.50 could however be accessed in fewer steps from a commercially available and cheap chiral starting material ( $S$ )-carvone 1.68. A Shapiro reaction on ketone 1.67, followed by coupling with a squarate species can then yield the bis-allylic alcohol 1.66. A thermal rearrangement reaction developed by Moore et al. ${ }^{25}$ would then furnish hydroquinone 1.65 , which can readily oxidise to the corresponding quinone. We anticipated that diene $\mathbf{1 . 5 0}$ could be obtained by a Suzuki coupling of alkene 1.65 with a vinyl stannane thus giving the key intermediate 1.50. A Diels-Alder cycloaddition reaction, followed by aromatic deprotection would complete a total synthesis of (-)-colombiasin A 1.10 in 7 steps (Scheme 1.9).

Scheme 1.9

In order to verify the viability of our proposed route, model studies were carried out. Firstly, synthesis of hydroquinone 1.65 was attempted. Secondly, appendage of the diene side-chain was tried. These model studies are described in detail in the following chapters.

## CHAPTER II - MODEL STUDIES: SYNTHESIS OF QUINONE 2.7

Our model studies were carried out on ( + )-dihydrocarvone 2.1 as it is an inexpensive and readily available chiral starting material. The first goal was to establish the validity of the cyclobutenone ring expansion strategy. This required the synthesis of tertiary alcohol 2.4 which in turn was to be prepared by coupling of vinyllithium 2.2 and a squarate compound 2.3. Various approaches to vinyllithium $\mathbf{2 . 2}$ are discussed as indeed is the nature of the squarate 2.3 . Finally, the thermal rearrangement of $\mathbf{2 . 4}$ to hydroquinone 2.5 , oxidation to quinone 2.6 and the final deprotection step are described (Scheme 2.1).

Scheme 2.1

## II.1-Vinyllithium

## i. via the Shapiro reaction

The Shapiro reaction provides a means to create a new C-C bond between the carbon centres of two ketones, simultaneously introducing a vinylic moiety into the product. In order to carry out the Shapiro reaction, formation of an aromatic hydrazone is necessary. Treatment with an alkyllithium base then converts the hydrazone into a dianionic species, which, upon warming to $-20^{\circ} \mathrm{C}$, decomposes directly to the vinyllithium (viz. $2.9 \rightarrow \mathbf{2 . 1 2}$, Scheme 2.2). For our purpose, the formation of an aromatic hydrazone from dihydrocarvone 2.1 was primordial.
a) Tosyl hydrazone

Tosyl hydrazone 2.8 was readily obtained in high yield by stirring dihydrocarvone $\mathbf{2 . 1}$ with tosyl hydrazine in acetic acid. However, when subjecting it to Shapiro conditions (i.e. adding 2 equivalents of butyllithium), the vinyllithium intermediate $\mathbf{2 . 1 2}$ was readily quenched by a proton source to give limonene 2.14. It is likely that the proton is abstracted from the 'tosyl' group as $\mathrm{SO}_{2}$ is a powerful "ortho-lithiating" directing group (Scheme 2.2).

Reagents/Conditions: i) tosylhydrazine, $\mathrm{AcOH}, \mathrm{RT}, 16 \mathrm{~h}, 84 \%$; ii) $n \mathrm{BuLi}$ (2 eq.), THF, $-78^{\circ} \mathrm{C}$ to $-20^{\circ} \mathrm{C}$, then squarate $2.13, \mathrm{THF},-78^{\circ} \mathrm{C}, 68 \%$.

Scheme 2.2

In order to favour quenching of the vinyllithium by the squarate electrophile 2.13, the next obvious choice was to transfer to an "ortho-protected" hydrazone and thus suppress formation of limonene $\mathbf{2 . 1 4}$.
b) Trisyl hydrazone

Formation of the trisylhydrazone of dihydrocarvone $\mathbf{2 . 1 5}$ proved to be more difficult than the tosyl hydrazone case. A number of methods have been reported for the formation of trisyl hydrazones, and a summary of the methods tried is given in Table 2.1.

| Solvent | Trisylhydrazide | Acid | Product |
| :---: | :---: | :---: | :---: |
| MeOH | 3.9 eq. | 0.1 eq. $(c \mathrm{HCl})$ | x |
| MeOH | 1.0 eq. | 0.1 eq. $(c \mathrm{HCl})$ | $55-89 \%$ |
| $\mathrm{Et}_{2} \mathrm{O}$ | 1.0 eq. | 0 eq. | x |
| $\mathrm{CH}_{3} \mathrm{CN}$ | 1.1 eq. | 1.1 eq. $(c \mathrm{HCl})$ | x |
| EtOH | 1.0 eq. | 0.06 eq. <br> $\left(p \mathrm{TsOH} . \mathrm{H}_{2} \mathrm{O}\right)$ | x |
| AcOH | 1.0 eq. | 0 eq. | x |

Table 2.1

Although in most cases TLC monitoring showed that a reaction had occurred, isolation of hydrazone $\mathbf{2 . 1 5}$ proved problematic with decomposition observed on both silica and alumina. On occasions when $\mathbf{2 . 1 5}$ could be isolated by filtration, yields varied between $55 \%$ and $89 \%$.

Since formation of the trisylhydrazone of cyclohexanone 2.47 was facile in our hands, it seems that the hindrance engendered by the proximal methyl group in $\mathbf{2 . 1}$ was responsible for its acute acid sensitivity.
Notwithstanding these difficulties, isolation of hydrazone 2.15 allowed us to test the Shapiro reaction with an "ortho-protected" aromatic hydrazone. Thus, when $\mathbf{2 . 1 5}$ was treated with $t$-butyllithium, formation of limonene $\mathbf{2 . 1 4}$ was reduced considerably and accounted for just $15 \%$ of the total mass-balance. The result suggests that proton quench primarily originates from the arene but that there is a secondary source, presumably the solvent or possibly one of the by-products other than the aromatic
portion. It was also found that, by reducing the length of time the reaction mixture was stirred at higher temperatures $\left(-20^{\circ} \mathrm{C}\right)$, this side-reaction was quasi eliminated. Thus, a fine balance needed to be struck so as to achieve complete decomposition of dianion 2.16 to vinyllithium 2.12 while simultaneously avoiding protonation of that intermediate. An important by-product of the Shapiro reaction was the result of an attack of vinyl anion 2.12 at the "ester-like" carbonyl to yield, after loss of tertbutanol, diketone 2.19. Despite this side reaction, we were pleased to isolate the desired alcohol 2.18 as the major product of the reaction (38\%). Alcohol 2.18 results from the attack of intermediate vinyllithium $\mathbf{2 . 1 2}$ at the more electrophilic carbonyl of squarate 2.17 (Scheme 2.3).

Reagents/Conditions: i) $t \mathrm{BuLi}$ ( 3 eq.), THF, $-78{ }^{\circ} \mathrm{C}$, 2 h ; ii) $-78^{\circ} \mathrm{C}$ to $-20^{\circ} \mathrm{C}$, 1 min. then $\mathbf{2 . 1 7}$, $\mathrm{THF},-78$ ${ }^{\circ} \mathrm{C}, 30 \mathrm{~min}$.

Scheme 2.3

Although hydrazone formation allowed us to try out the Shapiro reaction, the reaction proved so temperamental that alternative ways to access hydrazones were sought. An alternative route to trisylhydrazones is the prior reaction of ketones with hydrazine. The resulting hydrazone, when treated with trisyl chloride, should yield the sulfonated
product. However, our hopes of effecting the two-step synthesis of trisylhydrazone 2.15 were quickly dashed when treatment of dihydrocarvone 2.1 with hydrazine yielded the dimer $\mathbf{2 . 2 0}$ (Scheme 2.4).

Reagents/Conditions: i) $\mathrm{N}_{2} \mathrm{H}_{4} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{EtOH}, 100^{\circ} \mathrm{C}, 60 \mathrm{~h}, 40 \%$.

Scheme 2.4
c) One-pot Shapiro

The problems encountered with the isolation of hydrazone $\mathbf{2 . 1 5}$ led us to investigate a one-pot Shapiro reaction, whereby isolation of the hydrazone would be eliminated. Monitoring the hydrazone formation by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR showed that, when stirring dihydrocarvone 2.1 with trisylhydrazine in $\mathrm{CDCl}_{3}$ in the absence of acid, formation of the hydrazone 2.15 had occurred after 15 minutes. Longer reaction times led to decomposition as shown in Figure 2.1.

Figure 2.1

This spectroscopic evidence suggested that the solution could subsequently be subjected to the Shapiro conditions and quenched with squarate 2.17 in order to obtain the desired bis-allylic alcohol 2.18. Thus, assuming a change of solvent $\left(\mathrm{CDCl}_{3}\right.$ to THF) would be of no consequence, a solution of trisylhydrazine and dihydrocarvone 2.1 in THF was stirred at ambient temperature for 2 hours, after which it was treated with 4 equivalents of tert-butyllithium at $-78^{\circ} \mathrm{C}$. The characteristic observations were noted, i.e. colour change and nitrogen evolution upon warming to $-30^{\circ} \mathrm{C}$. Cooling down to $-78^{\circ} \mathrm{C}$ and quenching with squarate 2.17 indeed gave the desired product in a $38 \%$ yield.

Although encouraging results were obtained, the yields of alcohol $\mathbf{2 . 1 8}$ were still unsatisfactory. Therefore, we contemplated other ways in which the vinyllithium species could be accessed in situ.
ii. via vinyl iodides

Vinyllithiums can easily be accessed from vinyl iodides by a halogen-metal exchange reaction. Therefore, investigation into the formation of vinyl iodides was carried out.

## a) Hydrazones

Several ways to access vinyl iodides from ketones have been reported. For instance, converting ketone 2.1 to the corresponding hydrazone 2.21 , could open up many ways into the corresponding vinyl iodides $\mathbf{2 . 2 2} .{ }^{26-28}$ Again, however, we were quickly stopped in our attempts since treatment of dihydrocarvone 2.1 with hydrazine yielded the hydrazone dimer $\mathbf{2 . 2 0}$ (Scheme 2.5).

Reagents/Conditions: i) $\mathrm{N}_{2} \mathrm{H}_{4} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{EtOH}, 100^{\circ} \mathrm{C}, 60 \mathrm{~h}, 40 \%$.

Scheme 2.5
b) Vinyl phosphonates

Vinyl phosphonates upon treatment with TMSI have been reported to undergo transformation to the corresponding vinyl iodides. ${ }^{29}$ Thus, phosphonate 2.23 was synthesised by treatment of ketone 2.1 with LDA, followed by quenching with diethyl chlorophosphate. Upon treatment of 2.23 with TMSI (generated in situ), our observations revealed a migration of the terminal double bond and that the $\alpha, \beta$ unsaturated ketone $\mathbf{2 . 2 5}$ and conjugated vinyl iodide $\mathbf{2 . 2 6}$ had been formed in a 2:1 ratio.

Reagents/Conditions: i) preformed LDA, THF, $-78^{\circ} \mathrm{C}, 3 \mathrm{~h}$, then diethylchlorophosphate, $-78{ }^{\circ} \mathrm{C}$ to RT , 16h, $52 \%$; ii) NaI, TMSCl, MeCN, $15 \mathrm{~min}, 98 \%$.

## Scheme 2.6

These observations could be rationalised by the formation of intermediate 2.24. TMSI being a powerful Lewis acid, migration of the double bond to the more favourable isomer 2.24 occurred. "De-phosphorylation" or iodination could then ensue, leading to the formation of ketone $\mathbf{2 . 2 5}$ and iodide 2.26 respectively.
c) Vinyl stannanes

Following a string of disappointing results, our attention turned to vinyl stannanes as precursors to vinyl iodides. Thus, dihydrocarvone 2.1 was converted to the corresponding thermodynamic vinyl triflate 2.27 A. A palladium-catalysed crosscoupling reaction between triflate 2.27 A and hexamethylditin furnished stannane $\mathbf{2 . 2 8}$ in good yield (Scheme 2.8).

We were surprised to find that direct lithiation of the vinylstannane 2.28 using methyl lithium, $n$-butyllithium or even $t$-butyllithium failed to give the characteristic colour change and that only unreacted starting material was recovered. As the reaction ought to be thermodynamically favourable, we presume that it is too slow to be practicable for our purposes (Scheme 2.7).

2.28
$+$
RLi

2.12
$+$
$\mathrm{RSnMe}_{3}$

Scheme 2.7

In the hope of generating alcohol 2.18, direct treatment of vinyl stannane $\mathbf{2 . 2 8}$ with $\mathrm{BF}_{3} . \mathrm{OEt}_{2}$ and the electrophile 2.17 in DCM was attempted. However, this method also failed to give us the desired allylic alcohol 2.18. Eventually, it was found that iodination of 2.28 followed by lithium-halogen exchange did indeed yield the vinyllithium 2.12 in situ. Quenching with squarate $\mathbf{2 . 1 7}$ finally provided the bis-allylic alcohol 2.18 in good yields (Scheme 2.8).

2.1

2.27 A
2.28

2.22

Reagents/Conditions: i) preformed LDA, THF, $-78^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$ then N-phenyltrifluoromethanesulfonimide 2.51, $-78{ }^{\circ} \mathrm{C}$ to $\mathrm{RT}, 16 \mathrm{~h}, 61 \%$; ii) $\mathrm{Sn}_{2} \mathrm{Me}_{6}, \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}, \mathrm{LiCl}, \mathrm{THF}$, reflux, $16 \mathrm{~h}, 71 \%$ ( $+16 \% \mathrm{RSM}$ ); iii) $\mathrm{I}_{2}$, DCM, RT, $1 \mathrm{~h}, 99 \%$; iv) $t$-BuLi, THF, $-78^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$ then squarate $2.17, \mathrm{THF},-78^{\circ} \mathrm{C}$ to $\mathrm{RT}, 30 \mathrm{~min} ., 69 \%$.

## Scheme 2.8

Although the sequence to alcohol 2.18 was lengthened, the reliability of the chemistries combined with an improvement in the yields represented a great advantage over the Shapiro reaction.

## II. 2 - Squarate

## i. Methyl squarate

Our initial approach was to use squarate 2.13 as the electrophile for the Shapiro reaction. Dimethyl squarate $\mathbf{2 . 3 0}$ was synthesised in moderate yield ( $50 \%$ ) by refluxing squaric acid 2.29 in methanol and toluene under azeotropic removal of water. The yield could be optimised by repetitive removal of the azeotrope, thus pushing the equilibrium in favour of the desired diester $\mathbf{2 . 3 0}$. Treatment of $\mathbf{2 . 3 0}$ with methyllithium yielded alcohol $2.31(32 \%)$ and the acid catalysed rearrangement gave product $\mathbf{2 . 1 3}$ in an overall $17 \%$ yield (Scheme 2.9).

Reagents/Conditions: i) MeOH , toluene, reflux, $16 \mathrm{~h}, 49 \%$; ii) $\mathrm{MeLi}, \mathrm{THF},-78{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 32 \%$; iii) cHCl , DCM, RT, 1h, 53\%.

Scheme 2.9

The low yields observed in this sequence could be attributed to two factors. Firstly, the high volatility of these compounds lowered the isolation yields. Also, although strictly one equivalent of the organolithium reagent was used, on several occasions, double 1,2 -addition as well as 1,4 -addition to diketone 2.30 was observed. The resulting products were not easily separable by column chromatography and on treatment with acid, the unexpected rearrangement product 2.34 was obtained. This could be rationalised by the sequence shown in Scheme 2.10.

1,2-addition

2.30

1,2-addition

$2.31(\mathrm{R}=\mathrm{Li})$

2.32

2.33

Scheme 2.10

## ii. tert-Butyl squarate

Liebeskind and co-workers encountered similar difficulties and overcame the problem of 1,4-addition by the introduction of bulkier groups. ${ }^{30}$ Therefore, our efforts turned to the synthesis of di-tert-butyl squarate $\mathbf{2 . 3 5}$ from which diketone $\mathbf{2 . 1 7}$ can be derived. Squarate 2.35 was obtained by refluxing squaric acid 2.29 in tert-butanol in the presence of methyl orthoformate. The problem of 1,4-addition of methyllithium on 2.35 was indeed suppressed and after acid-catalysed rearrangement, diketone 2.17 was obtained in $47 \%$ overall yield from squaric acid.

Reagents/Conditions: i) methyl orthoformate, $t \mathrm{BuOH}$, reflux, $1 \mathrm{~h}, 70 \%$; ii) MeLi, THF, $-78{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 97 \%$; iii) $\mathrm{cHCl}, \mathrm{DCM}, \mathrm{RT}, 1 \mathrm{~h}, 69 \%$.

Scheme 2.11

The synthesis of electrophile 2.17 proved extremely facile and represented a clear advantage over that of methyl squarate 2.13. With foresight, deprotection of a tertbutyl ether requires milder conditions than the corresponding deprotection of a methyl ether. The use of $t$-butyl squarate $\mathbf{2 . 1 7}$ may therefore offer a further advantage by greatly facilitating the deprotection step in the late stages of our synthesis of colombiasin A.

## II. 3 - Rearrangement and oxidation

In the 1980s, substantial advances in the chemistry of cyclobutenediones and their usefulness in the synthesis of quinones were made by the groups of Liebeskind, ${ }^{31-41}$ and Moore. ${ }^{42,43}$ Interestingly, it was shown that addition of alkenyl or aryllithium reagents $\mathbf{2 . 3 8}$ to cyclobutenediones $\mathbf{2 . 3 7}$, followed by thermolysis, provided a range of highly substituted hydroquinones $\mathbf{2 . 4 0}$ in excellent yields (Scheme 2.12). ${ }^{25,40}$

Scheme 2.12

Having established a route to alcohol 2.18, we were able to apply the thermal rearrangement reaction, by heating a solution of $\mathbf{2 . 1 8}$ in xylene, or THF (sealed tube) to $130^{\circ} \mathrm{C}$. The reaction proceeded smoothly and in excellent yields ( $85 \%$ ), presumably via a ketene intermediate 2.41. It should be noted that although hydroquinone $\mathbf{2 . 5}$ was isolated, it was rapidly oxidised to the corresponding quinone $\mathbf{2 . 6}$ on standing in air. Indeed, after 24 hours, conversion to quinone $\mathbf{2 . 6}$ was complete. Deprotection of $\mathbf{2 . 6}$ with titanium tetrachloride concluded our model studies towards the synthesis of hydroxyquinone 2.7 (Scheme 2.13).

Reagents/Conditions: i) xylene or THF (sealed tube), $130^{\circ} \mathrm{C}, 25 \mathrm{~min}, 85 \%$; ii) air, $24 \mathrm{~h}, 100 \%$; iii) $\mathrm{TiCl}_{4}, \mathrm{DCM}, 0^{\circ} \mathrm{C}, 1 \mathrm{~min}$., $54 \%$.

Scheme 2.13

In summary, although encouraging results were obtained with the Shapiro reaction, we were pleased to have developed a more reliable route to alcohol 2.18 via a vinyl iodide intermediate. The thermal rearrangement-oxidation sequence proceeded smoothly and the final Lewis-acid catalysed deprotection concluded our model studies.

## CHAPTER III - MODEL STUDIES: SYNTHESIS OF DIENE 3.1

In this chapter, various means to elaborate diene $\mathbf{3 . 1}$ from dihydrocarvone 2.1 are described. Explorations of some facets of boron chemistry are discussed, as well as the use of metal-catalysed approaches for $\mathrm{C}-\mathrm{C}$ bond formation. Finally, the discussion focuses on means by which the new asymmetric centre was introduced in the dienone 3.1 with control of the absolute configuration.

Scheme 3.1

## III. 1 - Boron chemistry

## i. Suzuki coupling

Initial attempts to append the diene moiety in one step by a Suzuki coupling between iodide 3.4 and the hydroborated alkene 3.3 failed to produce the desired product (Scheme 3.2). At first, it was thought that the reaction was undermined by the hydroboration step. Spectroscopic evidence suggested that the ketone moiety instead of the alkene had been reduced. However, even when dihydrocarvone 2.1 was protected as its acetal 3.5 the reaction failed. Also, it was found that vinyl iodide 3.4 was difficult to isolate in a pure state and bypassing its purification gave no success. At this stage, failure could be attributed to a number of parameters including temperature, choice of catalyst, base, solvent, reaction times, etc. We therefore decided to seek a more robust synthesis of diene 3.1 involving more classical transformations.

Reagents/Conditions: i) 9-BBN, THF; ii) $\mathrm{I}_{2}$, THF; iii) Pd catalyst, base, heat.
Scheme 3.2

It should be noted that, contrary to our expectations, protection of ketone $\mathbf{2 . 1}$ as the corresponding acetal 3.5 failed to go in quantitative yields. Indeed, the presence of acid caused migration of the double bond to give the $\alpha, \beta$-unsaturated ketone $\mathbf{2 . 2 5}$ majorly (Scheme 3.3).

Reagents/Conditions: i) neopentyl glycol, $p \mathrm{TsOH}$, toluene, reflux, 16 h or neopentyl glycol, TMSCl , toluene, RT, 16 h .

## Scheme 3.3

This result suggested that ketone 2.1 should be protected as the silyl ether $\mathbf{3 . 7}$ to ensure better efficiency in the protection/deprotection step. Reduction of (+)-dihydrocarvone
2.1 with $\mathrm{LiAlH}_{4}$ resulted in a separable mixture of alcohols $\boldsymbol{( R )}$-3.6 and (S)-3.6 with the product of axial attack $(\boldsymbol{R})$-3.6 obtained predominantly (10:1). Protection of $\boldsymbol{( R )} \mathbf{- 3 . 6}$ with tert-butyldimethylsilyl chloride proceeded smoothly and in excellent yields (Scheme 3.4).

Reagents/Conditions: i) $\mathrm{LiAlH}_{4}, \mathrm{Et}_{2} \mathrm{O},-78{ }^{\circ} \mathrm{C}$ to $\mathrm{RT}, 30 \mathrm{~min}$., $96 \%$; ii) TBSCl, DMAP, imidazole, DCM, RT, $96 \mathrm{~h}, 99 \%$.

Scheme 3.4

## ii. Nucleophilic displacement

Despite low yields, a sufficient amount of acetal 3.5 was synthesised to allow us to attempt the introduction of the diene moiety by other means. Although the Suzuki coupling reaction had failed, further exploitation of boron chemistry developed by Brown et al. ${ }^{44}$ was attempted on our system. This consisted in sequential hydroboration of halo-alkyne 3.9 and alkene 3.5 with thexylborane in an attempt to bring about their union. It was hoped that activation of the borane 3.10 with sodium methoxide would cause migration of the primary alkyl residue with displacement of the halogen, thus yielding the desired diene $\mathbf{3 . 1 2}$ (Scheme 3.5). However, in our case, the products of the reaction remained unidentified and the approach was ultimately abandoned.

3.9

3.12
iv

3.11

Reagents/Conditions: i) $\mathrm{BH}_{3}, \mathrm{THF}, 0^{\circ} \mathrm{C}$; ii) 3.5 , THF, $-30^{\circ} \mathrm{C}$; iii) preformed 3.9 ; iv) $\mathrm{NaOMe},-30^{\circ} \mathrm{C}$.

Scheme 3.5

## iii. Hydroformylation

At this stage, we considered the use of hydroformylation as a means of introducing an extra carbon unit and the new stereogenic centre. The resulting aldehyde $\mathbf{3 . 1 5}$ could then undergo a Wittig olefination to yield diene 3.16. A boron-based approach
developed by Brown et al., ${ }^{45}$ whereby carbon monoxide inserts in an activated carbonboron bond only yielded unidentified products (Scheme 3.6).

Reagents/Conditions: i) 9-BBN, THF, $0^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$; ii) preformed $\mathrm{LiAlH}\left(\mathrm{OCH}_{3}\right)_{3}, \mathrm{THF}, 0^{\circ} \mathrm{C}$; iii) $\mathrm{CO}, 15$ min.

Scheme 3.6

## III. 2 - Metal-catalysed approaches

## i. Hydroformylation

A rhodium-catalysed approach developed by Alper et al. ${ }^{46}$ for the hydroformylation of alkenes could also provide us with aldehyde 3.17. However, the method requires relatively high pressures ( 8 atm ) and it was with little surprise that the reaction did not yield the desired aldehyde 3.17 when conducted using an in situ method for carbon monoxide generation (Scheme 3.7).

Reagents/Conditions: i) $\mathrm{Rh} / \mathrm{C}(5 \%)$, dppp, formic acid, DME, $100^{\circ} \mathrm{C}, 20 \mathrm{~h}$.

Scheme 3.7

## ii. Cross-metathesis

A cross-metathesis reaction between (+)-dihydrocarvone 2.1 and acrylonitrile was attempted using Grubb's catalyst but no reaction was observed (Scheme 3.8). Variants on Grubb's catalyst have been reported to catalyse cross-metathesis reactions, ${ }^{47,48}$ but the cost of these, as well as the scarcity of reported applications, led us to seek an alternative methodology.

Reagents/Conditions: i) tricyclohexylphosphine[1,3-bis(2,4,6-trimethylphenyl)-4,5-dihydroimidazol-2ylidene][benzylidene]ruthenium(IV) dichloride ( $5 \%$ ), acrylonitrile ( 5 eq .), RT, 16 hours or Grubb's II, $40^{\circ} \mathrm{C}, 48 \mathrm{~h}$.

Scheme 3.8

## III. 3 - Nucleophilic displacement

## i. Bromide

The approach adopted at this stage was to convert alkene 3.5 to the corresponding primary alkyl bromide 3.22 which could then undergo a nucleophilic displacement. Anti-Markovnikov addition of HBr across alkene 3.5 was achieved via a two-step process. Hydroboration followed by treatment with bromine and sodium methoxide yielded alkyl bromide 3.22 in $35 \%$ yield as an inseparable mixture of diastereomers. The alkyne anion 3.21 generated by treatment of 3.20 with either butyllithium or a Grignard reagent failed to displace the bromide and, under extended reaction times resulted in elimination to yield alkene 3.5 (Scheme 3.9).

3.23

3.5

Reagents/Conditions: i) $n \mathrm{BuLi}$ or $t \mathrm{BuLi}$ or EtMgBr then 3.22. ( $\mathrm{M}=\mathrm{Li}$ or MgBr )

Scheme 3.9

In order to "soften" the alkyne anion, a method developed by Wipf et al. ${ }^{49}$ was attempted. Hydroalumination of alkyne $\mathbf{3 . 2 0}$ followed by transmetallation to the corresponding copper(I) salt 3.27 and treatment with alkyl bromide 3.22 , should yield diene 3.12 (Scheme 3.10). Again, however, the reaction did not yield the desired product. These results suggested that the alkyl bromide was unreactive towards nucleophilic attack and conversion to a better leaving group was then sought.

3.12

Reagents/Conditions: i) DIBAL-H, hexane, $0{ }^{\circ} \mathrm{C}$ then $60^{\circ} \mathrm{C}$, 2 h ; ii) preformed $\left[\left(\mathrm{C}_{4} \mathrm{H}_{9} \mathrm{C}_{2}\right)_{2} \mathrm{CuCN}^{2}\right] \mathrm{Li}_{2}$, $25^{\circ} \mathrm{C}$; iii) 3.22 , THF, $-25^{\circ} \mathrm{C}$.

Scheme 3.10

## ii. Tosylate

Having protected (+)-dihydrocarvone $\mathbf{2 . 1}$ as the corresponding silyl ether 3.7 (Scheme 3.4), hydroboration of alkene 3.7, followed by oxidation, yielded primary alcohol 3.29 in excellent yield as a 1:1 inseparable mixture of diastereoisomers. Conversion to the corresponding tosylate $\mathbf{3 . 3 0}$, proceeded smoothly and it was found that addition of alkyne anion 3.21 in DMSO, yielded enyne $3.31 \mathbf{A}$ in good yield $(60 \%+$ RSM,

Scheme 3.11). Interestingly, when switching to THF as the solvent, the reaction failed, returning only unreacted starting material.
Having appended the 5 -carbon extension needed, reduction of the alkyne moiety remained to be performed. Reports of reduction of alkynes to alkenes using a hydride source led us to treat protected alcohol $\mathbf{3 . 3 1} \mathrm{A}$ and alcohol 3.31 $\mathbf{B}$ with $\mathrm{LiAlH}_{4}$ and DIBAL-H. ${ }^{50,51}$ However, even under extended reaction times, and elevated temperatures the alkyne remained untouched. Reduction using $\mathrm{H}_{2}$ and a poisoned palladium catalyst (Lindlar's catalyst) led to a myriad of overreduced products. These were copolar and could not be isolated in a pure state.

Reagents/Conditions: i) $\mathrm{BH}_{3}$.DMS, THF, $0^{\circ} \mathrm{C}$, 2 h , then $\mathrm{NaOH}, \mathrm{H}_{2} \mathrm{O}_{2}, 0^{\circ} \mathrm{C}$ to $\mathrm{RT}, 16 \mathrm{~h}, 88 \%$; ii) TsCl , $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCM}, \mathrm{RT}, 48 \mathrm{~h}, 75 \%$; iii) preformed $\mathbf{3 . 2 1}$, DMSO, RT, $1 \mathrm{~h}, 60 \%$ (+RSM); iv) TBAF, THF, RT, 72h, $95 \%$.

Scheme 3.11

Encouraged by the $\mathrm{S}_{\mathrm{N}} 2$ reaction observed on $\mathbf{3 . 3 0}$, we hoped to effect the nucleophilic displacement using vinyl anion 3.33, thus leading to diene $\mathbf{3 . 1 6}$ (Scheme 3.12). With vinyl stannane 3.2 in hand, we were able to attempt the displacement using various reaction conditions (Table 3.1).

Scheme 3.12

Again, however, only unreacted starting material was recovered, accompanied in some cases with alcohol 3.29. Although the use of DMSO as a solvent had given positive results in the case of the alkyne anion 3.21, it was readily deprotonated by the vinyl anion 3.33. Switching to THF as the solvent left the tosylate 3.30 unaffected, even when anion 3.33 was pre-treated with copper cyanide (Table 3.1).

|  | Reaction conditions | Product |
| :---: | :---: | :---: |
| i) <br> ii) | 3.2, $n$ BuLi, THF, $-78^{\circ} \mathrm{C}$ <br> 3.30 in DMSO | RSM |
| i) <br> ii) | 3.2, $n \mathrm{BuLi}$, THF, $-78^{\circ} \mathrm{C}$ <br> 3.30 in THF | RSM + alcohol 3.29 |
| i) <br> ii) <br> iii) | $\begin{aligned} & \text { 3.2, } n \mathrm{BuLi}, \mathrm{THF},-78^{\circ} \mathrm{C} \\ & \mathrm{CuCN} \\ & \mathbf{3 . 3 0} \text { in THF } \end{aligned}$ | RSM + unidentified product |

Table 3.1

Disheartened by our slow progress we decided to focus on a more classical way of introducing the side-chain. With tosylate 3.30 in hand, we were able to effect a cyanide displacement to yield nitrile 3.34. Reduction with DIBAL-H next furnished aldehyde 3.15 which could be coupled to a 4-carbon unit by means of a Wittig reaction or a Julia coupling to give diene 3.16 (Scheme 3.13).

Reagents/Conditions: i) $\mathrm{NaCN}, \mathrm{DMSO}, 90^{\circ} \mathrm{C}, 1 \mathrm{~h}, 99 \%$; ii) DIBAL-H, toluene, $0^{\circ} \mathrm{C}$ then $\mathrm{HCl}, \mathrm{RT}, 1 \mathrm{~h}$, 75\%.

Scheme 3.13
a) Wittig olefination

Phosphonium salt $\mathbf{3 . 3 6}$ has been used extensively as a building block in natural product synthesis. It is easily prepared by treatment of methallyl chloride 3.35 with triphenylphosphine. In our case, formation of the corresponding ylid using $n \mathrm{BuLi}$ or $t \mathrm{BuOK}$, followed by addition of aldehyde 3.15 yielded diene 3.16 in modest yield $(45 \%)$ as a $3: 1$ mixture of $(E)$ - and ( $Z$ )-isomers. The yields were considerably reduced when the reaction was performed on the free alcohol 3.39.

In an attempt to improve both the yields and $E: Z$ selectivity, we looked at a Horner-Wadsworth-Emmons variant using phosphine oxide 3.38 (Scheme 3.14). Unfortunately, in our case, no significant improvement was observed. This could be due to side-reactions that can occur when hydroxy-aldehyde 3.39 is treated with a base (e.g. aldol and Cannizzarro reactions). Protection of the alcohol may have improved the outcome of the reaction. However, a more appealing alternative was contemplated at this juncture.

Reagents/Conditions: i) $\mathrm{PPh}_{3}$, toluene, reflux, $16 \mathrm{~h}, 73 \%$; ii) chlorodiphenylphosphine, pyridine, ether, RT, $1 \mathrm{~h}, 48 \%$; iii) $n \mathrm{BuLi}$ or $t \mathrm{BuOK}$, THF, then 3.39 , THF.

Scheme 3.14
b) Kocieński-Julia coupling

The Kocieński-Julia olefination process provides a useful alternative to phosphinebased olefination reactions and makes use of benzothiazole sulfones. ${ }^{52}$ Sulfone 3.42 was easily accessible from mercaptothiazole $\mathbf{3 . 4 1} \mathrm{A}$ in two steps. Generation of the corresponding carbanion with NaHMDS and exposure to aldehyde 3.15 furnished diene 3.43 in good yields ( $70-90 \%$ ) and selectivity ( $7: 1, Z: E$ ). Notably, the selectivity was the reverse of that obtained using the Wittig protocol, the cis isomer being formed as the major product. For the purpose of our synthesis, iodine-catalysed isomerisation was used to convert this material into the trans isomer $\mathbf{3 . 1 6}$ (Scheme 3.15).

Reagents/Conditions: i) NaOMe , methallyl chloride, $\mathrm{MeOH}, \mathrm{RT}, 4 \mathrm{~h}, 91 \%$; ii) $\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24} \cdot 4 \mathrm{H}_{2} \mathrm{O}$, $\mathrm{H}_{2} \mathrm{O}_{2}$ ( $30 \%$ aq.), $\mathrm{EtOH}, 0^{\circ} \mathrm{C}, 20 \mathrm{~h}, 69 \%$; iii) NaHMDS, DME, $-50^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$ then $\mathbf{3 . 1 5}$, DME, $-50^{\circ} \mathrm{C}$ to RT, $14 \mathrm{~h}, 96 \%$; iv) $\mathrm{I}_{2}(1 \%), \mathrm{CHCl}_{3}, \mathrm{RT}, 1.5 \mathrm{~h}, 75 \%$.

Scheme 3.15

## III. 4 - Asymmetric induction

Having established a reliable route to diene 3.16, we focussed our attention on installing the correct stereochemistry at the C 7 centre. The first step in the sequence employed a hydroboration-oxidation reaction to give diols $\mathbf{3 . 4 5}$ and 3.46. We hoped that the use of a homochiral hydroborating agent would allow us to induce some selectivity in the formation of the new stereogenic centre (Scheme 3.16).

Scheme 3.16

Using both isomers of $\alpha$-pinene 3.47 and 3.48, and ( + )-longifolene 3.49, we were able to prepare the corresponding hydroborating agents, i.e. $(+)-\mathrm{Ipc}_{2} \mathrm{BH},(-)-\mathrm{Ipc}_{2} \mathrm{BH}$ and $(+)-(\mathrm{Lgf})_{2} \mathrm{BH}$ respectively. Trials on various substrates showed that the use of $(+)-$ $(\mathrm{Ipc})_{2} \mathrm{BH}$ on $(\boldsymbol{R})-\mathbf{3 . 6}$ led to a 2.3:1 mixture of desired and undesired diastereoisomers 3.46 and 3.45 respectively (Table 3.2)

3.47
(+)-alpha-pinene

3.48
(-)-alpha-pinene

3.49
(+)-longifolene

| Hydroborating agent | R group | Ratio 3.45:3.46 |
| :---: | :---: | :---: |
| $\mathrm{BH}_{3} \cdot \mathrm{DMS}$ | TBS | $1: 1$ |
| $\mathrm{BH}_{3} . \mathrm{DMS}$ | H | $1: 1$ |
| $(\mathrm{Lgf})_{2} \mathrm{BH}$ | TBS | $1: 1$ |
| $(\mathrm{Lgf})_{2} \mathrm{BH}$ | H | poor reaction |
| $(+)-(\mathrm{Ipc})_{2} \mathrm{BH}$ | TBS | $1: 2$ (inseparable) |
| $(+)-(\mathrm{Ipc})_{2} \mathrm{BH}$ | H | $1: 2.3$ (separable) |
| $(-)-(\mathrm{Ipc})_{2} \mathrm{BH}$ | TBS | $1: 1$ |
| $(-)-(\mathrm{Ipc})_{2} \mathrm{BH}$ | H | $1: 1$ |

Table 3.2

The advantage of carrying out the reaction on $(\boldsymbol{R})-\mathbf{3 . 6}$ is that the diastereoisomers could be separated by repetitive careful chromatography. Being crystalline products, we were able to identify by X-ray crystallography the relative stereochemistry of diastereoisomers $\mathbf{3 . 4 5}$ and 3.46. Pleasingly, we found that the major isomer $3.46(\mathrm{R}=$ H) had the correct relative configuration for the synthesis of (+)-colombiasin A (Figures 3.1 and 3.2).

Although the mechanism of asymmetric induction was not fully understood, we established that it was both substrate and reagent dependent. Indeed, treatment of alcohol $(\boldsymbol{S})$-3.6 with $(+)-\mathrm{Ipc}_{2} \mathrm{BH}$ did not yield the corresponding diols selectively, nor did ( - )-isopinocampheylborane exhibit an equal and opposite effect.

Figure 3.1

Figure 3.2

3.46
major

In summary, we have developed an asymmetric route to diene $\mathbf{3 . 1}$ from ( + )dihydrocarvone 2.1. A small sacrifice in terms of length has been compensated by the reliability and high yields in all steps (Scheme 3.16).

iii, iv

Reagents/Conditions: i) lithium aluminium hydride, $\mathrm{Et}_{2} \mathrm{O},-78{ }^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}, 80 \%$; ii) preformed ( + )( Ipc$)_{2} \mathrm{BH}, \mathrm{RT}, 2 \mathrm{~h}$, then $\mathrm{NaOH}, \mathrm{H}_{2} \mathrm{O}_{2}, 0^{\circ} \mathrm{C}$ to RT, $16 \mathrm{~h}, 93 \%$; iii) $\mathrm{TsCl}, \mathrm{NEt}_{3}, \mathrm{DCM}, \mathrm{RT}, 96 \mathrm{~h}, 85 \%$; iv) $\mathrm{NaCN}, \mathrm{DMSO}, 9{ }^{\circ} \mathrm{C}, 99 \%$; v) TBSCl, imidazole, DMAP, DCM, RT, $96 \mathrm{~h}, 99 \%$; vi) DIBAL-H, toluene, $0^{\circ} \mathrm{C}, 1 \mathrm{~h}$, then $\mathrm{HCl}\left(2 \mathrm{M}\right.$ aq.), $\mathrm{CHCl}_{3}, \mathrm{RT}, 1 \mathrm{~h}, 75 \%$; vii) 3.42, NaHMDS, DME, $-50^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$, then 3.15 , DME, $-50^{\circ} \mathrm{C}$ to RT, $14 \mathrm{~h}, 96 \%$; viii) $\mathrm{I}_{2}(1 \%), \mathrm{CHCl}_{3}, 1.5 \mathrm{~h}, 75 \%$; ix) TBAF ( 5 eq. ), THF, RT, $48 \mathrm{~h}, 99 \%$; x) DMP, DCM, $0^{\circ} \mathrm{C}$ to RT, $1 \mathrm{~h}, 80 \%$.

Scheme 3.16.

## CHAPTER IV - COLOMBIASIN A: THE LAST STEPS

## IV. 1 - Synthesis of quinone 4.1

Having successfully completed our model studies, we needed to establish the best route to quinone 4.1. With foresight, elaborating the diene side-chain onto quinone 2.6 would require some preliminary protection due to the nucleophilicity of the reagents used in the sequence (route A, Scheme 4.1). Similarly, formation of quinone 4.1 from dienone 3.1 (route B, Scheme 4.1), requires careful planning due to the sensitivity of the diene functionality.

2.6

3.1

route B

Scheme 4.1
i. Route A

With quinone 2.6 in hand, we envisaged applying the sequence depicted in Scheme 4.2 for the appendage of the side-chain. However, we anticipated that complications would arise right from the initial hydroboration step, since ketones are prone to react with
hydroborating agents. Further in the sequence, the use of sodium cyanide could also create unwanted side-reactions (e.g. cyanohydrin formation), not to mention the complications that could arise from the Julia olefination process. It was therefore thought that protection of quinone $\mathbf{2 . 6}$, or its precursor - hydroquinone $\mathbf{2 . 5}$, would be a necessary preliminary step for the successful installation of the diene side-chain (Scheme 4.2).

Reagents/Conditions: i) $\mathrm{NaH}, \mathrm{PMBBr}, \mathrm{TBAI},-10^{\circ} \mathrm{C}$ to $\mathrm{RT}, 20 \mathrm{~h}, 90 \%(+10 \% \mathrm{RSM})$.
Scheme 4.2

The advantage of using para-methoxybenzyl (PMB) protecting groups is their easy removal by DDQ, which, after side-chain elaboration, would simultaneously oxidise the resulting hydroquinone to the corresponding quinone 4.1. As shown in Table 4.1, protection of hydroquinone 2.5 proceeded smoothly and in excellent yield. However, synthesis of para-methoxybenzyl bromide by reaction of the corresponding alcohol
with phosphorus tribromide was compromised by its rapid decomposition at ambient temperature. Attempting the protection with para-methoxybenzyl chloride, hydroquinone 2.5 readily oxidised to the corresponding quinone 2.6 . This could be attributed to the lower reactivity of $p$-methoxybenzyl chloride, thus allowing the oxidative process to compete with the protection step. In an attempt to overcome this problem, the hydroquinone-quinone mixture was subjected to hydride reduction $\left(\mathrm{LiAlH}_{4}\right)$ in the presence of $p$-methoxybenzyl chloride. However, although oxidation of hydroquinone 2.5 was prevented, protection was not observed.
Another approach was to effect the thermal rearrangement of alcohol 2.18 in the presence of PMBCl and sodium hydride. This way, the intermediate hydroquinone $\mathbf{2 . 5}$ could be trapped as the corresponding PMB ether 4.2. Disappointingly however, the thermal rearrangement only yielded unprotected hydroquinone 2.5 (Table 4.1).

| Starting material | Reaction conditions | Outcome <br> (Yield) |
| :---: | :---: | :---: |
| hydroquinone 2.5 (R = H) | $\mathrm{NaH}, \mathrm{PMBBr}, \mathrm{TBAI}$ | $4.2(\mathrm{R}=\mathrm{PMB})$ <br> $(90 \%)$ |
| hydroquinone 2.5 (R = H) | $\mathrm{NaH}, \mathrm{PMBCl}, \mathrm{TBAI}$ | $\mathbf{2 . 6}$ <br> $(100 \%)$ |
| quinone 2.6 | $\mathrm{LiAlH}_{4}, \mathrm{PMBCl}$ | no reaction |
| alcohol 2.18 | heat, TBAI, PMBCl, <br> NaH | $\mathbf{2 . 5}(\mathrm{R} \mathrm{=} \mathrm{H)}$ <br> $(85 \%)$ |

Table 4.1

As an alternative solution, protection of quinone 2.6 as the bis-acetal 4.7 was attempted. The reaction, however, did not meet with the success we had wished (Scheme 4.3).

Reagents/Conditions: i) diphenylethylene glycol, $\mathrm{BF}_{3} . \mathrm{OEt}_{2}, \mathrm{DME}$.

Scheme 4.3

The difficulties encountered in our attempt to effect the protection of hydroquinone $\mathbf{2 . 5}$ and quinone 2.6 prevented the route described in Scheme 4.2 from being amenable to large-scale synthesis. These findings emphasised the need to introduce the quinone moiety in the latter stages of the synthesis.

## ii. Route B

Thus, we turned our attention to using dienone $\mathbf{3 . 1}$ as a building block onto which the cyclobutenedione moiety could be appended. This would consist in transforming ketone 3.1 into the corresponding vinyl triflate 4.8. A palladium catalysed transformation with hexamethylditin would then convert triflate 4.8 to stannane 4.9 . Treatment with iodine should furnish vinyl iodide 4.10 which, after treatment with $t \mathrm{BuLi}$, could be coupled to the squarate moiety. Thermal rearrangement of $\mathbf{4 . 1 1}$ should provide us with quinone 4.1 (Scheme 4.4). This approach however, also caused us concerns. The very presence of a diene functionality prohibits the use of palladium
catalysts, which had been used in our model studies for the transformation of vinyl triflate $\mathbf{2 . 2 7}$ A into vinyl stannane 2.28 (Scheme 2.8).

Scheme 4.4

Therefore, although our model studies had appeared to provide us with a useful alternative to the Shapiro reaction, we would be constrained to applying it as a means of obtaining quinone 4.1 (Scheme 4.5). Starting with ketone 4.12 (where the C7 stereocentre had not been defined), we attempted the formation of the corresponding trisylhydrazone 4.13 by treatment with trisylhydrazine in acidic methanol. As with our model studies, however, isolation and purification of hydrazone 4.13 proved difficult, presumably due to the acid sensitivity of the substrate. Therefore, the one-pot Shapiro protocol we had developed was applied once more. Thus, stirring ketone 4.12 with trisylhydrazine in THF for two hours and subjecting the solution to treatment with 3-4 equivalents of tert-butyllithium yielded alcohol 4.15 in poor yield (Scheme 4.5). The
low yields for this reaction were concordant with those obtained in our model studies. A number of side reactions were observed, notably quenching of the generated vinyllithium 4.14 to provide us with triene $\mathbf{4 . 1 8}(\mathrm{R}=\mathrm{H})$. Numerous attempts to favour quenching of the vinyllithium 4.14 by squarate 2.17 using temperature control or using a large excess of the squarate 2.17 led to an optimised yield of $24 \%$. Notwithstanding these difficulties, heating alcohol 4.15 in xylene or THF provided us with hydroquinone 4.16 in good yields. The advantage of using THF to effect the thermal rearrangement is that subsequent oxidation to quinone 4.17 occurred readily by stirring the resulting solution in air.

Reagents/Conditions: i) trisylhydrazine, THF, RT, 2h; ii) tBuLi (4eq.), THF, $-78{ }^{\circ} \mathrm{C}, 2 \mathrm{~h}$, then $-25^{\circ} \mathrm{C}, 2$ min.; iii) squarate 2.17 ( 6 eq .), THF, $-78^{\circ} \mathrm{C}, 30 \mathrm{~min}$., $24 \%$; iv) $130^{\circ} \mathrm{C}$, sealed tube, THF, 30 min ., then RT, open vessel, $24 \mathrm{~h}, 80 \%$.

Scheme 4.5

## IV. $2-(+)$-Colombiasin A $t$-butyl ether

With quinone 4.17 in hand, all that remained was to effect the cyclisation to yield (+)colombiasin A $t$-butyl ether 4.19. Heating 4.17 for 6 hours in the dark promoted the intramolecular Diels-Alder cycloaddition, and ( + )-colombiasin A $t$-butyl ether 4.19 was obtained in $60 \%$ yield as a $1: 1$ mixture of diastereoisomers (Scheme 4.6).

Reagents/Conditions: i) toluene, $180^{\circ} \mathrm{C}$, sealed tube, dark, $6 \mathrm{~h}, 60 \%(+20 \% \mathrm{RSM})$.
Scheme 4.6

According to our model studies, deprotection of the $t$-butyl enol ether with $\mathrm{TiCl}_{4}$ followed by HPLC separation of the diastereoisomers should complete the synthesis of $(+)$-colombiasin A 4.20. However, at this juncture, our attention turned to the synthesis of the naturally occurring diasteroisomer, (-)-colombiasin A.

## IV. 3 - Towards (-)-colombiasin A

Having finally established an effective route to quinone 4.17, and completed the synthesis of (+)-colombiasin A $t$-butyl ether 4.19, we were in a position to carry out the sequence on (-)-dihydrocarvone 1.67 in an asymmetric fashion to yield the natural diastereoisomer of colombiasin A .
$(-)$-Dihydrocarvone 1.67 needed to be synthesised from (S)-carvone 1.68 by reduction with L-selectride. Reduction of the enone $\mathbf{1 . 6 8}$ occurred preferentially from the top face, yielding (S)-1.67 and (R)-1.67 as a separable 8:1 mixture of diastereoisomers in $\mathbf{8 3 \%}$ yield. The major diastereoisomer ( $\boldsymbol{S}$ )-1.67 was taken through the same sequence described in the model studies with ( + )-dihydrocarvone 2.1. Thus, reduction of ( $\boldsymbol{S}$ )1.67 with $\mathrm{LiAlH}_{4}$ yielded a $10: 1$ mixture of diastereomeric alcohol $(\boldsymbol{S})-4.21$ and $(\boldsymbol{R})$ 4.21. Hydroboration of $(\boldsymbol{S})-4.21$ was effected using $(-)$-(Ipc) $)_{2} \mathrm{BH}$ to produce diol 4.22 as an enriched 3:1 mixture of diastereoisomers. Repetitive column chromatography allowed $(\boldsymbol{R})-4.22$ and $(\boldsymbol{S})-4.22$ to be separated and identified by analogy to their respective enantiomers 3.46 and $\mathbf{3 . 4 5}$ obtained in the model studies.

Conversion of diol ( $\boldsymbol{R}$ )-4.22 to the tosylate $\mathbf{4 . 2 3} \mathrm{A}$ required strictly one equivalent of tosyl chloride in order to prevent formation of bis-tosylate $\mathbf{4 . 2 3} \mathbf{B}$. Formation of nitrile 4.24, protection of the secondary alcohol with TBSCl and subsequent reduction to aldehyde 4.26 were facile and high yielding processes. The Kocieński-Julia olefination protocol was extremely efficient in yielding diene 4.27. However, cis selectivity (7:1) was observed and iodine catalysed isomerisation was required to convert the mixture to the trans adduct exclusively. Deprotection with TBAF followed by oxidation with DMP yielded ketone 4.29 B in moderate yield. The oxidation step was slightly undermined ( $75 \%$ yield) by the sensitivity of the diene moiety towards oxidising agents. Nevertheless, ketone 4.29 B was obtained as a single diastereoisomer in reasonable overall yield and the last crucial sequence could be tested (Scheme 4.7).

Reagents/Conditions: i) lithium tri-sec-butylborohydride, THF, $-78^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$, then $\mathrm{NaOH}, \mathrm{H}_{2} \mathrm{O}_{2}$, $0{ }^{\circ} \mathrm{C}, 1 \mathrm{~h}, 83 \%$; ii) lithium aluminium hydride, $\mathrm{Et}_{2} \mathrm{O},-78{ }^{\circ} \mathrm{C}$ to $0^{\circ} \mathrm{C}, 96 \%$; iii) preformed ( - )-(Ipc) $)_{2} \mathrm{BH}$, RT, 2 h , then $\mathrm{NaOH}, \mathrm{H}_{2} \mathrm{O}_{2}, 0^{\circ} \mathrm{C}$ to $\mathrm{RT}, 16 \mathrm{~h}, 93 \%$; iv) $\mathrm{TsCl}, \mathrm{NEt}_{3}, \mathrm{DCM}, \mathrm{RT}, 96 \mathrm{~h}, 85 \%$; v) NaCN , DMSO, $90^{\circ} \mathrm{C}, 99 \%$; vi) TBSCl, imidazole, DMAP, DCM, RT, $96 \mathrm{~h}, 99 \%$; vii) DIBAL-H, toluene, $0^{\circ} \mathrm{C}$, 1 h , then $\mathrm{HCl}(2 \mathrm{M} \mathrm{aq}),. \mathrm{CHCl}_{3}, \mathrm{RT}, 1 \mathrm{~h}, 75 \%$; viii) 3.42, NaHMDS , DME, $-55^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$ then $4.26, \mathrm{DME}$, $-55^{\circ} \mathrm{C}$ to $\mathrm{RT}, 16 \mathrm{~h}, 96 \%$; ix) $\mathrm{I}_{2}(1 \%), \mathrm{CHCl}_{3}, 1.5 \mathrm{~h}, 75 \%$; x) TBAF ( 5 eq .), THF, RT, $48 \mathrm{~h}, 99 \%$; xi) DMP, DCM, $0^{\circ} \mathrm{C}$ to RT, $1 \mathrm{~h}, 75 \%$.

Scheme 4.7

The one-pot Shapiro reaction on ketone 4.29 B yielded alcohol 4.32 in $24 \%$ yield. Heating alcohol 4.32 in THF to $130{ }^{\circ} \mathrm{C}$ in a sealed tube for 30 minutes and allowing the resulting solution to stir for 48 hours in air meant that isolation of hydroquinone 4.33 was bypassed and quinone 4.34 was obtained in high yields. Heating quinone 4.34 to $180^{\circ} \mathrm{C}$ in the dark for 12 hours yielded ( - -)-colombiasin A tert-butyl ether 4.35 in reasonable yield. 4.35 was then subjected to deprotection with $\mathrm{TiCl}_{4}$ (Scheme 4.8). Unfortunately, the scale on which the reaction was performed did not allow for conclusive characterisation of the product.

4.35
(-)-colombiasin A $t$-butyl ether

1.10
(-)-colombiasin A

Reagents/Conditions: i) TrisNHNH ${ }_{2}$, THF, RT, 2 h , then $t$-butyllithium (4 eq.), $-78{ }^{\circ} \mathrm{C}, 2 \mathrm{~h},-20{ }^{\circ} \mathrm{C}, 5$ min , then 2.17 in THF, $-78^{\circ} \mathrm{C}, 0.5 \mathrm{~h}, 24 \%$; ii) $130^{\circ} \mathrm{C}, 20 \mathrm{~min}$, sealed tube, THF, then RT, THF, 48 h , $85 \%$; iii) $180^{\circ} \mathrm{C}$, dark, toluene, $12 \mathrm{~h}, 60 \%$; iv) $\mathrm{TiCl}_{4}, \mathrm{DCM}, 0^{\circ} \mathrm{C}, 1 \mathrm{~min}$.

Scheme 4.8

## IV. 4 - Conclusion and further work

In summary, we have secured an asymmetric route to (-)-colombiasin A $t$-butyl ether. Particularly noteworthy is the cyclobutenone thermal rearrangement-aerial oxidationintramolecular Diels-Alder cycloaddition sequence used to construct the colombiane skeleton.

However, it should be noted that two main factors have undermined our synthesis of colombiasin A and these remain to be addressed. Firstly, although diol (R)-4.22 was prepared stereoselectively, its separation from diol $(\boldsymbol{S})-4.22$ by careful chromatography was extremely time-consuming. To overcome this problem, fractional recrystallisation of these diols could be attempted. Alternatively, an in-depth investigation of our initial idea, i.e. an asymmetric Suzuki coupling of $\mathbf{3 . 3}$ with 3.4 , would greatly facilitate the synthesis of (-)-colombiasin A.
Secondly, although the Shapiro reaction has provided us with a means to obtain key intermediate 4.32, the low yields observed at such a late stage in our sequence have prevented us from obtaining enough material to conclude the synthesis of the natural product. This problematic step could be addressed by a change in the electrophile used to quench vinyllithium 4.31. For instance, formation of a vinyl stannane intermediate could perhaps improve the yields of the Shapiro reaction as well as provide a way to access alcohol 4.32. Alternatively, the route depicted in Scheme 4.4 where vinyl triflate 4.8 is converted to vinyl stannane 4.9 by a palladium catalysed reaction, could prove more successful than anticipated, despite the presence of a diene moiety. These issues are currently being addressed and we are hopeful that they will be resolved shortly.

## CHAPTER V - EXPERIMENTAL

## V. 1 - General remarks

All air and/or moisture sensitive reactions were carried out under an inert atmosphere, in oven-dried glassware. Reactions were monitored by TLC using glass-backed plates coated with silica gel 60 containing a fluorescence indicator active at 254 nm ; the chromatograms were visualised under UV light ( 254 nm ) and by staining with, most commonly, $20 \%$ phosphomolybdic acid in ethanol or $10 \%$ aqueous $\mathrm{KMnO}_{4}$. Where flash chromatography was undertaken, Apollo silica gel (0.040-0.063 mm, 230-400 mesh) was used, slurry packed and run at low pressure. HPLC was performed using a Kontron Instruments pump with a $10 \mathrm{~mm} \times 250 \mathrm{~mm}$ Biosyl D 90/10 column eluting at $3 \mathrm{~mL} / \mathrm{min}$. Infrared (IR) spectroscopy was performed using a Bio-Rad FT-IR Goldengate spectrometer or Thermo Mattson Satellite FT-IR spectrometer. Positions of absorption maxima are quoted in $\mathrm{cm}^{-1}$. Letters after give an indication of the relative strength of the peak ( $\mathrm{w}=$ weak, $\mathrm{m}=$ moderate, $\mathrm{s}=$ strong, br. = broad, $\mathrm{v}=$ very). ${ }^{1} \mathrm{H}$, ${ }^{13} \mathrm{C},{ }^{19} \mathrm{~B}$ and ${ }^{31} \mathrm{P}$ spectroscopy was performed on a Bruker AC/AM300 or DPX400 spectrometer at operating frequencies indicated in the text. Chemical shifts are quoted as $\delta$-values in ppm and multiplicities are reported using the following notation: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, quint. $=$ quintet, $\mathrm{m}=$ multiplet, app. $=$ apparent, br. = broad, obsc. $=$ obscured. Chemical ionisation (CI) and electron ionisation (EI) mass spectroscopy was performed on a Thermoquest Trace GCMS spectrometer. Electrospray (ES) mass spectroscopy was performed on a Micromass Platform (MP) spectrometer. High resolution EIMS was performed on a VG Analytical 70-250-SE spectrometer and high resolution ESMS was performed on a Bruker Apex III spectrometer. Combustion analysis was performed by Medac Ltd. Melting points were carried out using a Griffin melting point apparatus and are uncorrected. Optical rotations were measured on a PolAAr 2001 polarimeter operating at a wavelength of 589 nm and an external temperature of $24^{\circ} \mathrm{C}$. Benzene, toluene, 1,4-dioxane, ether and THF were distilled from sodium immediately before use. Except in the case of toluene,
benzophenone was used as an internal indicator of water content. Chloroform and dichloromethane were distilled from calcium hydride immediately prior to use. Where appropriate, all other solvents and reagents were purified according to standard methods. ${ }^{53}$ Methallylphosphonium chloride was prepared by the method of Baird et al. ${ }^{54}$ Stannane 3.2 was prepared following the procedure of Aksela et al. ${ }^{55}$

## V. 2 - Synthetic procedures

## 3,4-Dimethoxycyclobut-3-ene-1,2-dione 2.30

Prepared following the procedure of Liebeskind et al. ${ }^{30}$ Thus, a stirred suspension of squaric acid $2.29(10.67 \mathrm{~g}, 94.00 \mathrm{mmol})$ in methanol ( 150 mL ) and toluene ( 150 mL ) was heated to reflux under azeotropic removal of water. After 16 hours, the solvents were removed in vacuo. The residual oily solid was once again suspended in methanol : toluene ( $1: 1,300 \mathrm{~mL}$ ) and the reaction mixture was heated to reflux with azeotropic removal of water for 16 hours. The solvents were removed in vacuo. The residual oil was taken up in ether $(200 \mathrm{~mL})$ and washed with a saturated sodium bicarbonate solution ( $2 \times 150 \mathrm{~mL}$ ) and brine $(100 \mathrm{~mL})$. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo to a white solid $\mathbf{2 . 3 0}$ $(6.56 \mathrm{~g}, 46.20 \mathrm{mmol}, 49 \%)$ which was recrystallised from ether/petroleum ether. Spectroscopic and physical data (except for melting point data) were in accordance with literature values. ${ }^{56}$

MP

## 4-Hydroxy-2,3-dimethoxy-4-methylcyclobut-2-en-1-one 2.31

Prepared following the procedure of Liebeskind et al. ${ }^{30}$ Thus, to a cooled $\left(-78{ }^{\circ} \mathrm{C}\right)$ solution of dimethyl squarate $2.30(1.23 \mathrm{~g}, 8.66 \mathrm{mmol})$ in THF ( 40 mL ) under nitrogen was added methyllithium ( $5.5 \mathrm{~mL}, 1.6 \mathrm{M}$ in ether, 8.75 mmol ) dropwise over 10 minutes. The reaction mixture was maintained at $-78{ }^{\circ} \mathrm{C}$ for 1 hour. Water $(10 \mathrm{~mL})$ was added and the reaction mixture allowed to warm to ambient temperature. Ether ( 20 mL ) was added and the phases separated. The aqueous phase was extracted with ether $(2 \times 20 \mathrm{~mL})$ and the combined organic phases were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo to a pale yellow oil $\mathbf{2 . 3 1}$ ( $0.44 \mathrm{~g}, 2.79 \mathrm{mmol}, 32 \%$ ).
Spectroscopic and physical data were in accordance with literature values. ${ }^{30}$

$\mathrm{C}_{10} \mathrm{H}_{16}$
$\mathrm{M}_{\mathrm{r}}=136$

To a stirred solution of tert-butyllithium ( $2.15 \mathrm{~mL}, 0.93 \mathrm{M}$ in pentane, 2.00 mmol ) in THF ( 10 mL ) at $-60^{\circ} \mathrm{C}$ under nitrogen was added hydrazone $2.8(0.16 \mathrm{~g}, 0.50$ mmol ) in THF ( 3 mL ) dropwise over 2 minutes causing the reaction to turn bright orange in colour. The reaction mixture was stirred at $-60^{\circ} \mathrm{C}$ for 1 hour, warmed to ambient temperature and stirred for a further 2 hours. The dark red solution was cooled to $0^{\circ} \mathrm{C}$ and dimethyl squarate $2.30(0.28 \mathrm{~g}, 2.00 \mathrm{mmol})$ in THF ( 2 mL ) was added dropwise. The reaction was allowed to warm to room temperature. After 2 hours, water $(10 \mathrm{~mL})$ was added and the reaction mixture stirred for a further 16 hours then extracted with $n$-pentane ( $2 \times 15 \mathrm{~mL}$ ). The combined organic extracts were washed with water ( $2 \times 15 \mathrm{~mL}$ ), saturated copper sulfate solution ( $2 \times 15 \mathrm{~mL}$ ) and brine ( $3 \times 15 \mathrm{~mL}$ ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}, 0 \%-5 \%\right.$ ether in petroleum ether) gave limonene $2.14(0.045 \mathrm{~g}, 0.33 \mathrm{mmol}, 66 \%)$ as a colourless oil.
Spectroscopic and physical data were in accordance with literature values. ${ }^{60}$

$1.5: 1$

To a solution of trisylhydrazone $2.15(0.98 \mathrm{~g}, 2.27 \mathrm{mmol})$ in THF $(20 \mathrm{~mL})$ at -78 ${ }^{\circ} \mathrm{C}$ under argon was added tert-butyllithium ( 3.1 mL of a 1.5 M solution in pentane, 4.65 mmol ) dropwise over 3 minutes causing the solution to become a bright orange colour. The reaction mixture was stirred for 75 minutes at $-78^{\circ} \mathrm{C}$ and was then gradually warmed to $-20^{\circ} \mathrm{C}$ where it was kept until gas evolution had ceased ( 5 minutes). It was then cooled to $-78^{\circ} \mathrm{C}$ and a preformed solution of diketone $\mathbf{2 . 1 7}$ ( $0.46 \mathrm{~g}, 2.74 \mathrm{mmol}$ ) in THF ( 5 mL ) was added dropwise over 5 minutes causing the mixture to turn pale yellow in colour. After stirring at $-78^{\circ} \mathrm{C}$ for 30 minutes, an ammonium chloride solution ( 20 mL ) was added and the reaction mixture was allowed to warm to ambient temperature. The aqueous phase was separated and extracted with ether $(3 \times 25 \mathrm{~mL})$. The combined organic phases were washed with brine ( 25 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo to a yellow oil. Purification by column chromatography $\left(\mathrm{SiO}_{2}, 10-80 \%\right.$ ether in petroleum ether) gave firstly $2.19(0.100 \mathrm{~g}, 0.43 \mathrm{mmol}, 19 \%)$ as a yellow oil, then the desired product $2.18(0.200 \mathrm{~g}, 0.66 \mathrm{mmol}, 29 \%, 2: 1$ mixture of inseparable diastereoisomers) as a pale yellow oily solid.

## 1,2,3,4-tetrahydronaphthalene 4.2

Prepared following the procedure of Jin et al. ${ }^{62}$ Thus, to a stirred suspension of sodium hydride ( $46 \mathrm{mg}, 1.15 \mathrm{mmol}$ ) in THF ( 5 mL ) was added hydroquinone $\mathbf{2 . 5}$ $(0.18 \mathrm{~g}, 0.59 \mathrm{mmol})$, p-methoxybenzyl bromide ( $0.23 \mathrm{~g}, 1.15 \mathrm{mmol}$ ), and tetrabutylammonium iodide ( $21 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) at $-10^{\circ} \mathrm{C}$ under nitrogen. The reaction mixture was allowed to warm to ambient temperature and after 16 hours, another aliquot of sodium hydride ( $46 \mathrm{mg}, 1.15 \mathrm{mmol}$ ), p-methoxybenzyl bromide ( $0.23 \mathrm{~g}, 1.15 \mathrm{mmol}$ ) and tetrabutylammonium iodide ( $21 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) were added. After stirring for 36 hours at room temperature, ammonium chloride (20 $\mathrm{mL})$ was added. The reaction mixture was extracted with ether $(3 \times 20 \mathrm{~mL})$ and the combined organic extracts were washed with brine ( 25 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo to a yellow oil. Purification by column chromatography $\left(\mathrm{SiO}_{2}, 5 \%-30 \%\right.$ ether in petroleum ether) gave firstly recovered hydroquinone $2.5(18 \mathrm{mg}, 0.06 \mathrm{mmol}, 10 \%)$ followed by alkene $4.2(0.28 \mathrm{~g}, 0.52$ $\mathrm{mmol}, 90 \%$ ) as a yellow oil.

## (2'RS,7R,10R)-10-(1'-Bromoprop-2'-yl)-3,3,7-trimethyl-1,5-dioxa-

 spiro[5.5]undecane 3.22

Prepared following the procedure of Brown et al. ${ }^{64}$ Thus, alkene $3.5(1.50 \mathrm{~g}, 6.30$ mmol) in THF ( 20 mL ) was treated with borane-THF complex ( $2.10 \mathrm{~mL}, 2.10$ mmol ) at $0{ }^{\circ} \mathrm{C}$ under nitrogen. The solution was allowed to warm to ambient temperature and stirred for one hour. A freshly prepared solution of sodium methoxide ( $0.16 \mathrm{~g}, 6.93 \mathrm{mmol}$ in 6.93 mL methanol) and bromine ( $0.32 \mathrm{~mL}, 6.30$ mmol ) was added simultaneously over 15 minutes. The orange solution was stirred for 20 minutes after which potassium carbonate ( 10 mL , saturated aqueous solution) and water ( 10 mL ) were added until all excess bromine had been destroyed. The resulting clear solution was extracted with ether $(3 \times 25 \mathrm{~mL})$. The combined organic extracts were washed with water $(2 \times 20 \mathrm{~mL})$ and brine ( 40 mL ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo to a pale yellow oil. Purification by column chromatography ( $\mathrm{SiO}_{2}, 0-1 \%$ ether in petroleum ether) yielded 3.22 ( $0.71 \mathrm{~g}, 2.23 \mathrm{mmol}, 35 \%$ ) as a clear oil and as an inseparable $1: 1$ mixture of diastereoisomers.

$[\alpha]$ D $+7.2\left(\mathrm{c}=0.15, \mathrm{CHCl}_{3}\right)$.

Prepared following the procedure of Corey et al. ${ }^{69}$ Thus, a cooled solution $\left(-78{ }^{\circ} \mathrm{C}\right)$ of vinyl iodide $2.22(0.56 \mathrm{~g}, 2.14 \mathrm{mmol})$ in THF ( 15 mL ) under argon was treated with tert-butyllithium ( 3.1 mL of a 1.5 M solution in pentane, 4.65 mmol ) dropwise over 5 minutes. After stirring for 1.5 hours, a solution of squarate $2.17(0.79 \mathrm{~g}, 4.70$ mmol ) in THF ( 10 mL ) was added. After 30 minutes, the reaction mixture was quenched with water ( 20 mL ) and extracted with ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic phases were washed with water ( 20 mL ) and brine ( 20 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo. Purification by column chromatography ( $\mathrm{SiO}_{2}, 10 \%-60 \%$ ether in petroleum ether) gave an inseparable 2:1 mixture of diastereoisomeric alcohol $2.18(0.45 \mathrm{~g}, 1.48 \mathrm{mmol}, 69 \%)$ as a pale yellow oily solid.

Data were in accordance with that described previously.

To a stirred solution of $N, N$-diisopropylamine ( $0.52 \mathrm{~mL}, 3.69 \mathrm{mmol}$ ) in THF ( 5 mL ) at $-78^{\circ} \mathrm{C}$ was added $n$-butyllithium ( $1.48 \mathrm{~mL}, 3.69 \mathrm{mmol}$ ) dropwise over 5 minutes. After 1.5 hours, (+)-dihydrocarvone $2.1(0.51 \mathrm{~g}, 3.36 \mathrm{mmol})$ in THF ( 5 mL ) was added and after 3 hours, diethylchlorophosphate $2.52(0.5 \mathrm{~mL}, 3.69$ mmol ) was added dropwise over 5 minutes. The reaction mixture was allowed to warm to ambient temperature and stirred for 16 hours. Water ( 10 mL ) was then added and the reaction mixture was extracted with ether $(3 \times 10 \mathrm{~mL})$. The combined organic phases were washed with water ( 10 mL ) and brine ( 15 mL ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo. Purification by column chromatography ( $\mathrm{SiO}_{2}, 5 \%-100 \%$ ether in petroleum ether) gave firstly recovered starting material $2.1(0.17 \mathrm{~g}, 1.12 \mathrm{mmol}, 33 \%)$ then phosphate $2.23(0.18 \mathrm{~g}, 0.62$ mmol, 19\%) as a yellow oil.

The experimental procedure used and, except for optical rotation, the spectral data attained were identical to those of the corresponding enantiomers $\mathbf{3 . 4 5}$ and 3.46.

Optical rotation for $(\boldsymbol{R}) \mathbf{- 4 . 2 2}$
$\left[\alpha_{D}\right] \quad+19.5\left(\mathrm{c}=0.52, \mathrm{CHCl}_{3}\right)$.

Optical rotation for ( $\boldsymbol{S}$ )-4.22
$[\alpha]_{D}$
$+13.1\left(\mathrm{c}=0.91, \mathrm{CHCl}_{3}\right)$.

To a stirred solution of alcohol $(\boldsymbol{R})-4.22(0.57 \mathrm{~g}, 3.31 \mathrm{mmol})$ in DCM ( 30 mL ) was added triethylamine ( $0.46 \mathrm{~mL}, 3.30 \mathrm{mmol}$ ) followed by $p$-toluenesulfonyl chloride $(0.63 \mathrm{~g}, 3.30 \mathrm{mmol})$ and the reaction mixture was stirred at room temperature for 72 hours. The reaction mixture was washed with water ( 20 mL ) and brine ( 20 mL ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo to a brown oil. Purification by column chromatography ( $\mathrm{SiO}_{2}, 10 \%-60 \%$ ether in petroleum ether) gave firstly tosylate $4.23 \mathbf{A}(0.78 \mathrm{~g}, 2.39 \mathrm{mmol}, 73 \%)$ as a colourless oil then recovered diol (R)-4.22 ( $92 \mathrm{mg}, 0.53 \mathrm{mmol}, 16 \%$ ).

## 2-Methyl-3-diphenylphosphinoyl-prop-1-ene 3.38

Prepared following the procedure of Yamamoto et al. ${ }^{73}$ Thus, a stirred solution of methallyl alcohol 3.37 ( $0.17 \mathrm{~mL}, 2.00 \mathrm{mmol}$ ) in ether ( 1.5 mL ) was treated with chlorodiphenylphosphine ( $0.36 \mathrm{~mL}, 2.00 \mathrm{mmol}$ ) followed by pyridine $(0.32 \mathrm{~mL}$, 4.00 mmol ) causing the clear reaction to turn milky white in colour. The reaction mixture was stirred for 1 hour before addition of potassium hydrogen sulfate ( 0.54 $\mathrm{g}, 4.00 \mathrm{mmol}$ ). After 5 minutes, the precipitate was filtered off, washed with ether $(10 \mathrm{~mL})$ and the filtrate was concentrated in vacuo. The residual oil was taken up in xylene ( 4 mL ) and heated to reflux for 25 hours. After cooling, the reaction mixture was concentrated in vacuo and the resulting oil was purified by column chromatography $\left(\mathrm{SiO}_{2}, 50-75 \%\right.$ ether in petroleum ether) to give the title compound $3.38(0.24 \mathrm{~g}, 0.93 \mathrm{mmol}, 48 \%)$ as a yellow oil and recovered starting material ( $56 \mathrm{mg}, 0.78 \mathrm{mmol}, 40 \%$ ).

Prepared following the procedure of Phillips et al. ${ }^{74}$ A cooled $\left(0^{\circ} \mathrm{C}\right)$ solution of benzothiazole $3.41 \mathbf{B}(2.00 \mathrm{~g}, 9.05 \mathrm{mmol})$ in ethanol ( 35 mL ) under nitrogen was treated dropwise with a solution of ammonium molybdate tetrahydrate $(0.44 \mathrm{~g}, 0.36$ mmol ) in hydrogen peroxide ( $30 \% \mathrm{aq} ., 3.60 \mathrm{~g}, 31.77 \mathrm{mmol}$ ). The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 3.5 hours and was then placed in the freezer for 16 hours. Evaporation of the solvent in vacuo gave a yellow solid which was taken up in DCM ( 20 mL ) and washed with sulfuric acid ( $2 \mathrm{M}, 50 \mathrm{~mL}$ ). The aqueous phase was extracted with DCM ( $2 \times 30 \mathrm{~mL}$ ). The combined organic extracts were washed with brine ( 50 mL ), dried over $\mathrm{MgSO}_{4}$, filtered and concentrated in vacuo to give a pale yellow solid. Recrystallisation from DCM/EtOH gave sulfone $\mathbf{3 . 4 2}$ as offwhite crystals ( $1.58 \mathrm{~g}, 6.24 \mathrm{mmol}, 69 \%$ ). Physical and spectroscopic data were in accordance with the literature. ${ }^{74}$

Prepared following the procedure of Kocieński et al. ${ }^{75}$ Thus, a stirred solution of sulfone $3.42(0.84 \mathrm{~g}, 3.32 \mathrm{mmol})$ in DME ( 10 mL ) at $-55^{\circ} \mathrm{C}$ under argon was treated dropwise with sodium hexamethyldisilazide ( 1 M solution in THF, 3.32 mL , 3.32 mmol ) causing the solution to turn deep red. After stirring at $-55^{\circ} \mathrm{C}$ for 70 minutes, a solution of aldehyde $4.26(0.92 \mathrm{~g}, 3.08 \mathrm{mmol})$ in DME ( 5 mL ) was added. The reaction mixture was allowed to gradually warm to room temperature and stirred for 16 hours. Water ( 10 mL ) was added and the reaction mixture stirred for a further hour. Following extraction with ether $(3 \times 20 \mathrm{~mL})$ the combined organic extracts were washed with water ( 20 mL ) and brine ( 25 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo. Purification by column chromatography $\left(\mathrm{SiO}_{2}, 100 \%\right.$ petroleum ether) gave diene $4.27(1.00 \mathrm{~g}, 3.00 \mathrm{mmol}$, $96 \%$ ) as a clear oil and as an inseparable $7: 1$ mixture of cis : trans diastereoisomers.

Only data for the cis isomer are reported.

A stirred solution of trisylhydrazide 2.45 ( $81 \mathrm{mg}, 0.27 \mathrm{mmol}$ ) in THF ( 5 mL ) was treated with a solution of ketone 4.29 B ( $60 \mathrm{mg}, 0.27 \mathrm{mmol}$ ) in THF ( 2 mL ) and the resulting clear solution was stirred at ambient temperature under argon for 3 hours. The solution was then cooled to $-78{ }^{\circ} \mathrm{C}$ and treated with $t$-butyllithium $(0.84 \mathrm{~mL}$, 1.09 mmol ). The resulting orange solution was stirred at $-78{ }^{\circ} \mathrm{C}$ for 2 hours, then gradually warmed to $-25{ }^{\circ} \mathrm{C}$ and cooled again to $-78{ }^{\circ} \mathrm{C}$ at which point it was treated with a solution of squarate $2.17(0.27 \mathrm{~g}, 1.63 \mathrm{mmol})$ in THF ( 5 mL ). The resulting reaction mixture was stirred for a further 30 minutes, quenched with water $(15 \mathrm{~mL})$, and allowed to warm to ambient temperature. The phases were then separated. The aqueous phase was further extracted with ether ( $3 \times 20 \mathrm{~mL}$ ). The combined organic extracts were washed with water ( 15 mL ), brine ( 20 mL ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated in vacuo to a yellow oil. Purification by column chromatography ( $\mathrm{SiO}_{2}, 5 \%-55 \%$ ether in petroleum ether) gave the title alcohol 4.32 ( $24 \mathrm{mg}, 0.065 \mathrm{mmol}, 24 \%$ ) as a $2: 1$ mixture of inseparable diastereoisomers and as a pale yellow oil. Data were recorded on the mixture.

## 5,6,7,8-tetrahydro-1,4-naphthalenedione 4.34

A solution of alcohol $4.32(0.025 \mathrm{~g}, 0.067 \mathrm{mmol})$ in THF ( 2 mL ) was heated to 120 ${ }^{\circ} \mathrm{C}$ in a sealed tube. After 25 minutes, the sealed tube was opened up to the atmosphere and the solution was stirred at ambient temperature for a further 24 hours. The bright yellow solution was concentrated in vacuo and purified by column chromatography ( $\mathrm{SiO}_{2}, 5 \%$ ether in petroleum ether) to give quinone 4.34 $(0.020 \mathrm{~g}, 0.054 \mathrm{mmol}, 80 \%)$ as a bright yellow oil.

Sheldrick, Acta Cryst. (1990) A46 467-473). Structure refinement: SHELXL97 (G. M. Sheldrick (1997), University of Göttingen, Germany). Graphics: Cameron - A Molecular Graphics Package. (D. M. Watkin, L. Pearce and C. K. Prout, Chemical Crystallography Laboratory, University of Oxford, 1993).

## Special details:

All hydrogen atoms were fixed.
It was not possible to accurately determine the absolute structure.
The relative stereochemistry is $R, R, R, S(\mathrm{C} 1, \mathrm{C} 3, \mathrm{C} 6, \mathrm{C} 8)$ and all three molecules are the same.

Table 6.8. Atomic coordinates $\left[\times 10^{4}\right]$, equivalent isotropic displacement parameters [ $\AA^{2} \times 10^{3}$ ] and site occupancy factors. $U_{e q}$ is defined as one third of the trace of the orthogonalized $U^{i j}$ tensor.
