Of Small Ships Forgotten

by

Jack William Francis Pink

Ordinary ships such as merchant schooners—and most importantly the people involved in their lives—are often absent from contemporary discussions and narratives of the 19th century. Those ships have the potential to improve and refine our understanding of the 19th century Maritime World. Their absence from contemporary discussions suggests there are gaps and blind spots in our understanding of the period. A challenge faced by archaeologists and historians is that only a small number of such ships have been explored in any detail. It is also clear that archaeology has a lot to add to and challenge about our understanding of the 19th century more generally. Therefore, this thesis introduces new material through the material culture documentation of several hundred ships, sourced from the archives of the Lloyd's Register which at the time was the world's largest shipping registration organisation. That material will be used to move beyond individual vessel-narratives to produce new knowledge and ideas of seafaring and shipbuilding from this period.

This thesis presents a theoretical and methodological framework to integrate large documentary datasets into an archaeological investigation. Part of this process includes a re-evaluation of the 19th century Maritime World through the lens of Britain's coastal merchant shipping and the systems and forces that industry operates within. That revaluation provides the backdrop and context to a large-scale evaluation of British shipping numbers in the 19th century, setting those numbers against key events and changes that have previously been attributed to changes in the shipbuilding and seafaring industries. The investigation then becomes more granular. First, by taking the registration records of 200 individual merchant schooners and exploring their biographies to extract information about their construction and use. Then two of those ships will be examined in the finest detail possible by including archaeological investigation of their material remains and other relevant documentary sources to set out their story in detail.

Presenting those stories allows this thesis to create two anchor points in the dataset which have the investigation of their documentary record supported by real material evidence. Anchoring the documentary evidence in this way deploys an explanatory and narrative power to convey a story of the 19th century Maritime World and expand our understanding of the events that took place and the role Britain's shipbuilding and seafaring technologies played in industrialisation and globalisation. This use of narrative also allows this thesis to better move between scales, link different sources, and ensure the investigation focuses more effectively on the people involved with the ships discussed here. Therefore, this thesis presents an understanding of 19th century ships that is supported by relevant data and a record of individual ships that is larger than any other study undertaken for this topic.

Research Thesis: Declaration of Authorship

Print name: Jack Pink

Title of thesis: Of Small Ships Forgotten

I declare that this thesis and the work presented in it are my own and has been generated by me as the result of my own original research.

I confirm that:

1. This work was done wholly or mainly while in candidature for a research degree at this University;
2. Where any part of this thesis has previously been submitted for a degree or any other qualification at this University or any other institution, this has been clearly stated;
3. Where I have consulted the published work of others, this is always clearly attributed;
4. Where I have quoted from the work of others, the source is always given. With the exception of such quotations, this thesis is entirely my own work;
5. I have acknowledged all main sources of help;
6. Where the thesis is based on work done by myself jointly with others, I have made clear exactly what was done by others and what I have contributed myself;
7. Parts of this work have been published as:-

Pink, J., & Whitewright, J. (2022). A Life Less than Ordinary: The Schooner Ocean (1821–1865). *Historical Archaeology*, 56(1), 3-15.

Signature: Date: 22nd May 2023

Definitions and Abbreviations

- HEC.....The Lloyds' Register Foundation Heritage and Education Centre. This is the organisation that maintains and enhances the archive of the Lloyds' Register, including the Lloyds' Register of Shipping and associated survey documents.
- Lloyds' Register (LR)Defined here as it is the foundation of many of the abbreviations subsequently used in the thesis text. The Lloyd's Register was established in 1760 to establish if ships were safe and seaworthy using a system of characterisation based upon the condition of the hull and ship's equipment (discussed in more detail in Chapter 5) in response to increases in ships, and cargoes, lost at sea.
- LRF.....The Lloyds' Register Foundation owns Lloyds Register as it exists today including the archives and historic material that have been generated since the Lloyds' Register's inception. Most of the archival and documentary material from Lloyds' Register used in this project was accessed through the Lloyds' Register Foundation.
- LRS.....The Lloyd's Register of Shipping often referred to elsewhere as "The Register" this is a record of merchant shipping published annually since 1775. Prior to 1870 only vessels classed by Lloyds' Register were included. After 1870 all self-propelled, sea-going, merchant ships over 100 tons were recorded regardless of classification.
- Maritime WorldUsed here to describe the assemblage of systems, people, objects, forces, machines, countries, and places that exist in the period.
- Paper Ships.....The term used for the ships selected from the Lloyds' Register of Shipping that exist as entries in The Register without any material remains currently identified.
- Paper FleetThe collective term used for the 200 Paper Ships
- The RecordThe narrative presented through historical and archaeological sources, rather than seeing the "archaeological record" and the "historical record" as distinct entities.
- SchoonerA carvel-built ship rigged with a fore and aft sail on each mast. In this thesis the term includes both two and three-masted vessels.

Appendix A The Paper Ships: Biography Tables of Ships Extracted from the Lloyd's Register of Shipping

The following Appendix contains the Biography Tables for the Paper Ships. These have been constructed using information taken from the *Lloyds Register of Shipping* (LRS). Each line in a table relates to the entry on the corresponding volume of the LRS. Therefore, each table details the life of each ship through the records of the Lloyd's Register. This does not always mean the full life of any ship is contained in these records. There are some examples where the construction date recorded for the ship aligns with the date the ship first appears and the final entry contains definitive information that a ship was Wrecked or Abandoned. In these cases we can be certain the entire life of a ship is recorded. However, there are also entries where the first entry for a ship comes several years after the recorded construction date. These entries are particularly common in the first decade of the 19th century although they are present throughout the Paper Fleet. There are also entries where no definitive reason for the ship to disappear from the LRS is given, in these cases it is impossible to know if the final entry denotes a ship's last year of life or if there is some other reason it is no longer registered as a Merchant Ship —as was the case for *Rhoda Mary* in Chapter 7.

The Paper Fleet is arranged alphabetically by the name of the ship in keeping with the system used by the creators of the LRS. None of the LRS books for the 19th century arranged ships chronologically by year of build as has become convention in modern literature. These tables have been formatted to contain all the fields present in the LRS after 1870 when the Register Books are altered to include more information such as Registered Dimensions. In the case of ships that entered and left the LRS prior to these changes these columns have been left blank. In the cases of ships which were in the Register during the change these entries have been left blank until the new information is added at which point the new headings have been marked to indicate the additional information.

Appendix B Metallographic and Metallurgical Analysis of Fastenings from *Ocean* and *Rhoda Mary*

Two reports were provided on the metallurgical composition of yellow-metal fastenings found on the wreck site of the schooner *Ocean* and in the hulk of *Rhoda Mary*. Fastenings were recorded in-situ photographically and using an RTK GPS system. These were then sampled and submitted to Dr. Peter Northover for analysis. The samples from *Ocean* were submitted alongside samples from a Series of Solent Wrecks gathered by the Maritime Archaeology Trust (MAT). The results from the other wrecks have been omitted from this Appendix as they are not relevant to this thesis and form part of ongoing projects by the MAT. Otherwise, the reports have been included in their entirety and in their original format.

B.1 *Ocean/East Winner Bank Shipwreck: Analysis and Metallography of Bolts and Sheathing from Solent Wrecks*

Dr Peter Northover
Metallurgy and Archaeology

**ANALYSIS AND METALLOGRAPHY OF
BOLTS AND SHEATHING FROM SOLENT WRECKS**

ANALYSIS AND METALLOGRAPHY OF A FASTENINGS AND SHEATHINGS FROM SOLENT WRECKS

Samples of copper or copper alloy fastenings and sheathing from three wrecks were supplied by the Maritime Archaeology Trust for metallurgical study. The purpose of the study was to determine whether the pieces were consistent with the proposed identification of the wrecks. An origin in Iran and an Islamic date were proposed.

Sampling and analysis

Small sub-samples were cut from each of the pieces submitted and were labelled and identified as follows:-

#R5098	Keel bolt	East Winner Bank	? <i>Ocean</i>
#R5099	Floor/timber bolt	Hayling Island	? <i>Invincible</i>
#R5100	Sheathing		? <i>Christiana</i>
#R5161	Butt end bolt (01)	East Winner Bank	? <i>Ocean</i>
#R5181	Bolt (02)	East Winner Bank	? <i>Ocean</i>

The samples were hot-mounted in a carbon-filled thermosetting resin, ground and polished to a 1 μ m diamond finish. Analysis was by electron probe microanalysis with wavelength dispersive spectrometry. Operating conditions were an accelerating voltage of 20kV, a beam current of 30nA, and an X-ray take-off angle of 40°. Counting times were 10s or 20s per element, and pure element and mineral standards were used. Eighteen elements were analysed as listed in accompanying table; detection limits were 100-200ppm for most elements, except 300ppm for gold. The writer is grateful to Mr Chris Salter of Oxford Materials Characterisation Service for assistance with this analysis.

Five areas, each 30x50 μ m, were analysed on each sample. The individual analyses, normalised to 100%, are given in the table; all concentrations are in weight %. Table of other analyses from the same sites or presumed sites is also appended.

The samples were then examined metallographically in both as-polished and etched states; the etch used was an acidified aqueous solution of ferric chloride further diluted with ethanol.

The alloys and their metallography

Because four of the five samples in the present tranche of analyses are of corroded $\alpha\beta$ brasses it is necessary to discuss the alloy composition in tandem with the metallography in order to estimate the impact of the dezincification of the β phase. The analyses are grouped by site and for clarification the chart for Hayling Island and the East and West Winner Banks is included.

East Winner Bank wreck - #R5098/5161/81

All three samples are from $\alpha\beta$ brasses with the β phase partly or wholly corroded out. As measured the alloys fall into two groups with #R5098/5161 with close to 30% zinc and #R5181 with 38.76% zinc. This last was measured on an area of uncorroded brass and will represent the original alloy composition less any percentage of zinc lost to the atmosphere during melting and pouring. The original composition of this latter alloy would have been around 40% zinc, the specification of Muntz metal. Muntz metal was patented in 1832 and began to be adopted by the merchant fleet in the later 1830; when the patent expired in 1846 G.F. Muntz patented a new alloy with an addition of 3.25% lead but, so far, no example has been identified by analysis, not surprising because the alloy would be extremely difficult to hot roll.

Definitions and Abbreviations

A visual estimation of the volume of β phase in #R5098/5161 suggests that the difference in measured zinc contents is real and that the original alloy content was of the order of 33-34% of the order of a modern 2:1 brass.

In all three cases the principal impurities are iron, arsenic, and, lead with traces of nickel silver, bismuth, cadmium, and sulphur. Comparison with the writer's own database suggests that this pattern is typical of brass produced in Britain in the 19th century, low levels of impurities assisting both hot-and cold-working properties of the brass.

The differences between the two alloys are also reflected in the microstructures. #R5098/5161 have a heavily deformed structure with the β phase largely de-zincified. The section displayed in #R5098 is roughly parallel to the rolling direction and that in #R5161 is transverse (Figures 1-5). #R5181 is distinctly different having a visibly higher proportion of β phase and a structure nearer to as cast (Figure 6). The conclusion must be that they represent two different productions of bolts and two episodes of construction or repair.

The location of East Winner Bank wreck has led to its being provisionally identified as the *Ocean*, a schooner built in Brixham in 1821 and iron bolted. For her service in British coastal waters she would not have been coppered. She is recorded in Lloyd's register as having partially new wales and topsides in 1840, a new deck and large repairs in 1850 and small repairs in 1852. If she did receive brass bolts it is much more likely that this happened in 1850 and 1852 rather than 1840 when the use of brass bolts was still not widespread. The two types of bolt alloy could relate to the two latter repairs or might simply be a function of different manufacturing processes for different bolt sizes. It would be wise, though, at this stage to keep an open mind on the identification of the wreck as she *Ocean* could well have been repaired with iron bolts.

ANALYSIS AND METALLOGRAPHY OF TWO BRASS BOLTS FROM THE *RHODA MARY* WRECK SITE

Sections of two brass bolts from the wreck site of the *Rhoda Mary* in the Medway, illustrated as the frontispiece of this report, were submitted for metallurgical study.

Rhoda Mary was a schooner of 99 tons built at Point, Falmouth in 1868 for the Baltic trade. As such she would be expected to be iron-fastened but by 1894 Lloyd's Register reports her as being part iron-bolted, so brass bolts can be anticipated to be found in her hull from at least that early.

Sampling and analysis

A single sample was cut from each cross-section, and identified and labelled as follows:

RMYMB001	stern, first futtock	#R5624
RMYMB002	bow floor/first futtock	#R5633

The samples were hot-mounted in a carbon-filled thermosetting resin, ground and polished to a 1 μ m diamond finish. Analysis was by electron probe microanalysis with wavelength dispersive spectrometry; operating conditions were an accelerating voltage of 25kV, a beam current of 30nA, and an X-ray take-off angle of 40°. Eighteen elements were analysed as indicated in the accompanying table; counting times were 10s or 20s per element and pure element and mineral standards were used. Detection limits for most elements were 100-200ppm. The writer is grateful to Mr Chris Salter of Oxford Materials Characterisation Service for assistance with this analysis.

Five areas, each 30x50 μ m, were analysed on each sample; the individual analyses and their means are given in the accompanying table; all concentrations are in weight %.

The alloy

The compositions of the two bolts are so similar that they can be discussed together, differences between the individual compositions arising mainly from the degree of dezincification by corrosion at each analysis location and, possibly, also because of some segregation in the original cast bars.

The two bolts were formed from a yellow brass with 30.3-33.5% zinc, and a small quantity of lead, 0.15-0.42%. Other impurities were 0.03% iron, 0.01-0.06% nickel, 0.09-0.26% arsenic, and 0.02-0.04% cadmium; there were also traces of antimony, silver, bismuth, and sulphur. Given their position in the hull it seems improbable that they relate to her conversion to a houseboat.

There has been no systematic study of brass fastenings from merchant ships and the writer must rely on his own database, which includes both vessels built with brass fastenings and those repaired with them; the relevant data are attached to this report. This rather random selection suggests that the bolts from the *Rhoda Mary* site are very typical of brass fastenings from the second half of the 19th century and they could have been used either when she was built or during a later repair.

Metallography

To learn more about the history of these bolts a metallographic examination was made (Figures 1-3). The as-polished samples (#R5624 (Figure 1), #R5633 (Figure 3) show a corroded $\alpha\beta$ brass with much of the β phase has been removed by dezincification corrosion, something that could not be prevented and might ultimately shorten the service life of the bolts. Etching (Figure 3) shows how the original cast brass structure had been deformed, while the recrystallised grain

Definitions and Abbreviations

structure of the surviving α phase indicates that the bolt has been either cold worked and annealed or hot worked; for the proposed dating of the bolts hot working is probably the most likely.

Conclusions

The composition and the structure of the two bolts from the *Rhoda Mary* are very typical of the small number of brass bolts analysed from British merchant ships of the second half of the 19th century. This supports the suggestion that they pre-date her conversion to a houseboat.
