An international online collaborative learning project for occupational therapy students: a mixed-methods study

Abstract

Background: Internationalisation-at-home facilitates intercultural learning and cultivates global citizenship opportunities for students in higher education while in their home environments. The International Discussions in Occupational Therapy (i-DOT) project is an annual, online collaborative learning initiative that supports occupational therapy education.

Aim: This study aimed to assess the benefits of the i-DOT project and identify factors influencing student participation.

Material and methods: A convergent mixed methods design was used. Quantitative survey data and qualitative focus groups or interviews were gathered from occupational therapy students and educators involved in the project.

Results: Data were collected from 139 students who completed an online questionnaire and 14 students and educators who participated in the focus groups/interviews. Reported benefits included improved social and interpersonal skills, professional, and academic development, and increased diversity awareness. Most students indicated that these outcomes would not have been achieved through engagement with peers from their own country alone. Challenges to participation were attributed to logistical issues and participant-related difficulties.

Conclusion and significance: Participation in the i-DOT project enabled equitable international engagement for occupational therapy students. Despite participation barriers, occupational therapy students enhanced their learning and developed skills essential for independent professional practice.

10 **1. Introduction**

11 Internationalisation in higher education exposes students to intercultural learning, promotes global
12 citizenship, and prepares students for employment in diverse international settings [1,2].
13 Internationalisation-at-home (IaH) is an equitable and widely used method of achieving
14 internationalisation in higher education [3]. IaH was discussed as early as 1999 and first defined
15 in 2000 [4]. IaH has recently been redefined as “the purposeful integration of international and
16 intercultural dimensions into the formal and informal curriculum for all students, within domestic
17 learning environments” [5].
18
19

20 Given the broad definition of IaH, its implementation encompasses diverse learning
21 opportunities to achieve its central outcome [6]. One opportunity is international online
22 collaborative learning (OCL) [7], characterised by virtual exchanges between geographically
23 distant students to stimulate learning [8]. These projects involve students from higher education
24 institutions (HEIs) in two or more countries and may include shared online teaching and student
25 conversations. International OCL offers documented benefits across academic levels, including
26 improved understanding of course content and enhanced cultural awareness and sensitivity [9].
27 OCL also fosters the development of both professional and soft skills [10-12] and supports
28 personal growth in areas such as self-efficacy and self-confidence [13].
29
30

31 Well-documented challenges of OCL projects include language barriers, technological
32 difficulties, limited digital literacy [14], and time zone or time management challenges [13,15].
33 Participation in OCL is facilitated by the use of multimedia resources [8,16] and the provision of
34 clear expectations by educators [15,17].
35
36

37 International OCL is increasingly used in health education, emphasising the development of
38 culturally competent clinicians capable of working in diverse populations [18]. In occupational
39

1
2
3
4
5
6
7
8 therapy, OCL prepares students for multicultural clinical settings and helps conceptualise
9 occupation in the context of culture and occupational justice [19,20]. The International Discussions
10 in Occupational Therapy (i-DOT) project is one such OCL initiative.
11
12

13
14 The i-DOT project is an annual OCL initiative in which occupational therapy students from
15 eight European, African, and Asian countries engage in virtual discussions on occupational therapy
16 topics (e.g., older adults). Students share societal and professional perspectives from their home
17 countries with peers abroad and international organisations. Over a month, students participate in
18 two to three discussion sessions, independently coordinating their virtual exchanges.
19
20

21
22 The project originated at the Artevelde University of Applied Science in Ghent, Belgium in
23 2018. By the time of this study, it had expanded to nine international institutions, a development
24 accelerated by the rapid uptake of information and communication technology (ICT) in higher
25 education during the COVID-19 pandemic [21].
26
27

28 The i-DOT structure allows HEIs to retain institutional autonomy. Institutions determine
29 whether student participation is compulsory or voluntary, whether academic output is required,
30 and whether their students will be assessed. Preparation, closure, and evaluation are conducted
31 independently by each institution. However, resources such as guiding questions for discussions
32 and shared materials are standardised across all student groups. The i-DOT project supports
33 sustainability and enables broad, synchronous international participation annually.
34
35

36 While several studies have explored IaH in occupational therapy, none have investigated an
37 OCL project that involves students from multiple continents concurrently, as does i-DOT. Given
38 its unique, discipline-specific, and globally inclusive design, this study aimed to assess the benefits
39 of the i-DOT project and examine factors influencing student participation. Identifying the

enablers and barriers to participation can provide deeper insight into the mechanisms that facilitate or hinder student engagement in OCL projects in HEI settings.

2. Material and methods

2.1. Study Design

A convergent mixed-methods design was used [22] to evaluate the benefits of the i-DOT project and investigate factors contributing to student participation. Data from quantitative and qualitative approaches were collected in parallel and merged for comparison, enabling a more comprehensive understanding of the results and combining the strengths of both methods [23].

2.2. Participants

Occupational therapy students registered in the 2022 i-DOT project formed the study population for both methods. Additionally, occupational therapy educators (OTEs) directly involved in the i-DOT project were included in the qualitative phase to obtain their perspectives. OTEs who were part of the research team were excluded.

Eligible participants were invited via their OTEs through a link to the electronic questionnaire. The invitation stated that participation was voluntary, that they could withdraw at any time, and that confidentiality would be maintained. Informed consent was obtained before participation.

2.2. Data collection and analysis

2.2.1. Quantitative data

A self-developed survey was designed based on the study objectives and informed by benefits, barriers, and facilitators identified in previous OCL-related studies. The survey included both closed- and open-ended questions. Closed-ended questions primarily used 5-point Likert scales,

single-response, and multiple-response formats. Open-text boxes were provided for elaboration, and seven open-ended questions specifically explored student experiences. The 54 questions were grouped into six sections: (i) demographic information; (ii) general experience; (iii) academic and professional development; (iv) personal and social development; (v) cultural awareness; and (vi) overall experience. The survey, developed in English, was translated into German and reviewed by two native German-speaking researchers. Final versions were available in both languages. A senior research consultant and a statistical analyst validated the survey and reviewed and modified the questions according to the study's objectives. A pilot study with 13 participants from six countries and first-language groups assessed validity, and feedback was incorporated into the final survey.

Quantitative data were analysed using descriptive statistics, including mean, median, and range. Open-ended responses were analysed using content analysis [24,25]. The German responses were translated into English and verified by two native German-speaking researchers.

35 2.2.2. *Qualitative data*

36 Data were collected via focus groups and interviews, which were digitally recorded and transcribed
37 using automated software. A semistructured interview schedule (supplementary data) was
38 developed based on the literature and study objectives. Transcriptions were reviewed for accuracy.
39 At least three researchers independently analysed each anonymised transcript to ensure rigour.

40 An adapted hybrid thematic analysis was conducted [26], based on Braun and Clarke's [27]
41 six-step coding process. Themes were defined according to the study objectives, after which
42 coding commenced. Credibility was ensured through regular researcher meetings to resolve
43 discrepancies and confirm interpretation.

1
2
3
4
5
6
7
8
9 2.3. *Integrated analysis*

10
11 The qualitative and quantitative data were analysed separately and then integrated to address the
12 study's three objectives [26]. A simultaneous bidirectional framework was used for data merging
13 [28]. The results are presented as descriptive statistics with tables, alongside qualitative themes
14 and supportive quotations.
15
16
17

18
19 3. Results
20
21

22 3.1. *Demographic characteristics*
23
24

25 Survey responses were collected from 139 occupational therapy students for the quantitative phase,
26 and the response rate was 69.5%. All nine of the HEIs involved in i-DOT are represented in Table
27 1. For the qualitative phase, we conducted three student focus groups (each with 10 participants)
28 and one OTE focus group (with three participants). We also interviewed two OTEs individually
29 due to scheduling difficulties that prevented them from participating in the focus group. Thus, 14
30 participants were included in the qualitative method. Austria, Kuwait and the United Kingdom
31 were represented by two students each, whereas South Africa was represented by four. The OTE
32 focus group included three educators from institutions in Belgium, Croatia, and Southampton in
33 the United Kingdom. One OTE from Croatia and another from Derby in the United Kingdom were
34 interviewed individually.
35
36
37
38
39
40
41
42

43 The participants' details are presented in Table 1. The participants represented students from
44 different institutions, with perceived English proficiency ranging from poor to excellent. The mean
45 age of the students was 22.32 ± 6.28 years. The main findings were established according to the
46 study's three objectives and are presented in the following sections.

3.2. Benefits of participating in the i-DOT

36 According to the quantitative data, most participants (77.7%) agreed that they benefited from the
37 i-DOT project. The largest proportion of participants agreed that they benefited in terms of social
38 and interpersonal skills, followed by accelerated professional development (Fig. 1).

41 [insert figure 1 here]

44 3.2.1. Professional and academic advancement

45 Participants obtained a greater understanding of occupational therapy in terms of the models
46 of practice, intervention strategies, and practice areas (i.e., school-based, geriatrics and refugees).

49 Participants emphasised that:

1
2
3
4
5
6
7
8 *'For example in Croatia there is no occupational therapy in schools. We don't have therapy*
9 *in schools... just realising occupational therapy can be in schools was a whole new level of*
10 *excitement' (AFG3).*

11
12
13 The participants also learned about occupational therapy educational systems in other countries.

14
15 *'It was a chance to get to know their degree is for three years and ours for four years, and*
16 *what they do is different from us, and how they actually attend classes' (SFG8).*

17
18 Most students agreed that the project raised their awareness of diversity and expanded their
19 thinking beyond previous realms.

20
21 *'Being able to see a bigger picture... is something that's really important' (AFG5).*

22
23 *'We got provided interesting personal views on occupational therapy of the foreign partner'*
24 *(SFG5)*

25
26 Hence, the benefits were linked to the international nature of the project, as 75.54% of the
27 participants believed that their learning experience was richer than it would have been if they had
28 only interacted with students from their own country.

29
30 *'The exchange was really interesting because we got another view of an occupational*
31 *therapist who is in another country' (SFG6).*

32
33 Students realised that cultural and geographical factors would affect their occupation. This
34 understanding could help them to work with diverse populations. Students deepened their
35 understanding of diversity and acquired lifestyle, cultural, political, and religious literacy.

36
37 *'So, I think if anything, they learned more about our cultural differences' (SFG8)*

38
39 *'The topic of diversity was brought up and it was the highlight of all of our discussions. We*
40 *kept comparing our cultures, comparing the religions, comparing how things are practiced'*
41 *(SFG3).*

Additionally, 67.63% of the students agreed that they developed their professional identity as future occupational therapists, and 79.85% were convinced that the skills learned during the project could benefit them in future working environments. An example of this is:

'The communication skills that we developed; we will use forever... If you are not willing to make a plan and adapt, then it's not going to work' (SFG2).

Table 2 shows the different professional, personal, and social benefits of student participation in the i-DOT.

Table 2. Areas of professional, personal and social benefits upon students' participation in i-DOT

Area of development*		% of students citing improvement in this skill
Professional skills	Communication skills	91.37%
	Teamwork and collaboration	61.87%
	Time management	56.83%
	Organisation skills	54.68%
	Critical thinking skills	33.09%
Personal growth	Confidence in myself	66.19%
	Self-awareness	42.45%
	Motivation to learn	40.29%
Social growth	Confidence in communicating with new people	83.45%
	Skill in active listening	81.29%
	Ability to respect different views and beliefs of others	69.78%
	Making new friendships	46.04%

*Participants could select more than one response

3.2.2. Personal and social growth

Table 2 shows that most students felt more confident communicating with new people (83.45%), left their comfort zone, and improved their active listening skills (81.29%). The focus group discussions underline this by:

'If anything, that i-DOT project... helped me a lot in having to interact and getting out of my little box of just only talking to people that I'm comfortable with' (SFG8).

1
2
3
4
5
6
7
8
9 Students reported that the project added to their social growth.

10
11 'So, I think the main goal was to take the step to others and yes, to develop yourself and your
12 competence' (SFG5).

13
14 The students also emphasised becoming more confident (66.19%) and more self-aware (42.45%),
15 which enabled them to broaden their horizons. The students' growth in social connections,
16 communication (91.37%), and organisational skills (54.68%) was notable. The participants made
17 friends, connected on a deeper level, and helped each other with assignments. The participants
18 maintained contact with their partners beyond the project. One participant stated:
19
20
21
22
23
24
25
26
27

3.3. Challenges to participation

Our findings highlighted barriers that hampered students' ability to engage with the project, as summarised through two main categories, namely, logistical and participant challenges.

3.3.1. Logistical challenges

The logistical challenges included the busy academic schedules of students (43.17%), poor internet connectivity (39.57%), technological difficulties (25.18%), dealing with different time zones (13.67%), and overloading (7.19%) by the country's power utility as electricity demand exceeded supply (Table 3).

Qualitatively, participants did not find different time zones as difficult to navigate as initially anticipated when scheduling meetings. Furthermore, connectivity issues did not appear to hinder students' overall engagement, with one participant saying:

'We just laughed it out when people had like connection issues' (SFG3).

1
2

5
6
7
8
9
10 **Table 3.** Challenges experienced during the i-DOT project
11

Experienced challenge*	% of participants who experienced the challenge
Language barrier	43.88%
Scheduling suitable times with my partner	43.17%
Challenges with internet connectivity	39.57%
Communication difficulties	30.22%
Technological difficulties	25.18%
Limited understanding of what was expected	20.14%
Understanding or navigating time zones	13.67%
Interpersonal skills	7.91%
Loadshedding	7.19%
Partner student dynamic	5.76%
Miscellaneous	5.76%
Busy academic schedule	4.32%
Different HEIs requirements	1.44%
None	2.16%

30 *Participants could select more than one response
31
32

33 *3.3.2. Participant challenges*
34

35 Language was challenging for many participants (Table 3), given that the project was conducted
36 in English, which was not a first or second spoken language for some students. Nevertheless, fewer
37 than half of the participants (only 43.88%) reported it as a challenge. One OTE stated:
38

39 *'I think they feared the most the language barrier but... during the interviews they realised it
40 was not as much of a problem as they anticipated it to be' (AFG3).*

41 Some participants were anxious before the project. They were unsure of expectations and the
42 unknown. Some participants were concerned about their partners being more prepared than they
43 were.
44

45 *'I don't know if they were given like the same like information as us' (SFG9).*

6
7
8 Encouragingly, when asked to describe how OTEs helped them prepare for potential challenges,
9 only 9% of the participants indicated that they were unprepared, with the others highlighting
10 varying levels of preparation. This preparation helped them to overcome challenges as they arose.
11
12 Given the flexible nature of the project (i.e., compulsory vs voluntary student involvement or
13 expected outcomes), participants displayed different levels of commitment and responsiveness to
14 the project, which affected their dynamics. One of the participants stated:
15
16 'you needed to get it [the project] done but the people don't come back to you' (SFG2)

17 Although we anticipated that being in different academic years would affect student participation,
18 only 2.2% of the participants cited that this negatively affected their interactions (Figure 2).

20
21
22
23
24
25
26
27 **3.4. Facilitators to participation**

28 The facilitators are reported in two categories, namely, student-led facilitators and facilitators
29 related to the projects' structure.

30
31
32
33 **3.4.1. Student-led facilitators**

34 Student-led facilitators included students planning for discussions, using tactics to increase
35 communication, and addressing language barriers. Language translation software facilitated
36 participation.

37 'So it was very common for me and my partners to just pause the meeting for a minute and
38 just go to Google Translate and translate what we're trying to deliver' (SFG3).

39 The participants mentioned that digital tools and virtual platforms created a "safe setting" and a
40 less confrontational environment.

41
42
43
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60 'The [computer] screen is between us and we can freely speak' (AFG2).

The freedom to use multiple ICT or social media platforms for communication was also helpful.

1
2
3
4
5
6
7
8 *'They had a group on WhatsApp and they were trying to do it via voice messages because it*
9 *was easier to them to like, record a message than to type because of the language barriers'*
10 *(AFG3).*

11
12 Most students (90.69%) agreed they had sufficient technological skills to participate in the i-DOT
13 project. Personal characteristics, such as being flexible, reliable and well prepared, were also
14 facilitators. Additionally, motivation or willingness to participate in the project was an important
15 facilitator.

16
17 *'Their [the students] willingness is what matters, because time is there, flexibility can be very*
18 *easy, but it's their willingness to make some time' (SFG3).*

19
20 Among the students, 45.32% stated they were internally motivated to participate despite not
21 receiving any marks (Figure 3). The association between motivation and grading was investigated
22 via Fisher's exact test. In this study, motivation was not associated with grading.

23
24 [insert figure 3 here]

25
26 3.4.2. *Facilitators related to the project's structure*

27
28 The structure of the i-DOT project facilitated participation. OTEs mentioned that guiding questions
29 for discussion helped the students to engage.

30
31 *'I think for students, ...having questions before was very beneficial ...they can plan in*
32 *advance, they can prepare, they can have the questions before them. So that was the best part.*
33 *But that works really well' (AFG3).*

34
35 Input from external sources, including preparation led by the OTEs, peer-mentorship from
36 occupational therapy students, and motivation from students who had previously participated in
37 the i-DOT project, was helpful.

Participants indicated that the duration of the project (one month, with two to three discussions) was adequate (Table 4). When additional information was sought from potential future facilitators, students recommended greater engagement with OTEs during and after the project, and increased alignment in preparatory activities across institutions.

Table 4. Participants' perceptions on the length of the i-DOT project

	Statement	% of participants
	The length of the i-DOT project was adequate	74.10%
The length of the project	I would have liked the i-DOT project to be over a shorter period of time (shorter than one month)	10.07%
	I would have liked the i-DOT project to be over a longer period of time (longer than one month)	15.83%
	The number of discussion sessions during the i-DOT project was adequate.	78.42%
The number of sessions during the project	I would have liked more discussion sessions during the project	15.11%
	I would have liked fewer discussion sessions during the project	6.47%

4. Discussion

While several studies have explored IaH initiatives in occupational therapy, none have examined an OCL project involving students from eight countries across three continents, as in the i-DOT project. This study offers insights into the benefits that occupational therapy can gain from broad international collaboration. The benefits extend beyond academic and intercultural learning, commonly emphasised in occupational therapy-specific IaH literature [20,29]. This study reports that participants experienced professional, personal, and social growth and developed a broader awareness of diversity beyond cultural dimensions.

Occupational therapy education is guided by the World Federation of Occupational Therapists' Minimum Standards, revised in 2016 [30]. These guidelines advocate for curricula

grounded in local contexts and informed by global perspectives [30]. The transformative potential of the i-DOT project, evident in students' reflections, highlights the need for further internationalisation of the profession. Students appreciated the opportunities afforded by the virtual exchange, which aligns with prior findings on its value for intercultural learning [14]. The online format promotes equity and enables diverse international contexts otherwise unavailable locally.

Knopf, Stumpf and Michelis [8] reported that student discussions enhanced their understanding of Bloom's Taxonomy and fostered their critical thinking skills. In i-DOT, students expanded these benefits by applying theoretical concepts to their own contexts, enriching their peers' understanding of occupational therapy. This mirrors outcomes from other OCL studies [19,31]. Engaging with theory and practice appeared to strengthen students' professional identity [32,33]. The i-DOT structure, which fosters communication and critical thinking, supported the development of these skills among students, skills central to their future employability [34].

Personal growth included increased confidence, self-awareness, motivation to learn, and personal insight, consistent with previous findings [11,12,16,35]. In this study, social growth was reflected in students' ability to engage constructively across differences and recognise diverse values and perspectives. Similarly, Todorova, Fattinger [14] and Erdei, Rojek and Leek [11] reported this growth in their students. Participants also formed cross-cultural friendships that persisted beyond the project, a notable strength of this initiative.

While intercultural learning is a traditional marker of internationalisation [18,20], students in this study noted that their understanding of culture would inform their future practice. However, diversity was experienced through and via lifestyle, political, and religious factors.

Participants reported typical OCL challenges such as poor internet connectivity [13,36], yet many overcame them. Most students demonstrated adequate digital skills, likely due to increased ICT use during the COVID-19 pandemic [21]. Language barriers posed the greatest limitation, though fewer than half of the students were affected. Participants used language translation software and translanguaging skills to facilitate communication, enhancing their learning experience [37].

Encouragingly, in this project, contrary to Aldrich and Johansson [38], being in a different year of academic study did not hamper participants' interactions. For most students, it was seen as an enabler.

Several enablers of student participation in the i-DOT were identified. Students took active roles, using creative strategies to overcome challenges, and remained motivated even when participation was not linked to formal assessment. This intrinsic motivation highlights the value the students placed on the experience. Student initiative and ownership were key to project success [15,39].

While OTE's input was vital [9], peer support and mentorship, especially from former participants, also facilitated engagement. The project's structure, described in the introduction, was pivotal to its success [40]. Students cited the flexibility of the project, collaborative institutional design, and student autonomy as key contributors to a positive learning environment. These elements created an enjoyable and low-pressure experience that enhanced learning.

4.1. Implications for educational practice

This study underscores the value of integrating OCL into curricula. The i-DOT project supported transformative learning across academic, professional, and personal domains.

1
2
3
4
5
6
7
8 Educational institutions should consider incorporating OCL to develop intercultural
9 communication, teamwork, and adaptability, skills essential for diverse work environments.
10
11

12 The approach is not limited to occupational therapy and may be adapted across disciplines.
13 Short-term OCL engagements (2–3 hours) can yield substantial outcomes, making them feasible
14 in existing curricula.
15
16

17 **4.3. Methodological considerations/limitations and future directions**

18
19

20 This study's limitations included unequal representation across participating countries and
21 data collection coinciding with academic year-ends and vacations. Participants were likely
22 predisposed to engagement, potentially skewing findings. Future research should include students
23 who opted not to participate to better understand participation barriers. A pretest–posttest design
24 is recommended to provide quantifiable evidence of OCL benefits. Future studies could explore
25 OCL models pairing students from different countries and health disciplines to enhance
26 interprofessional education.
27
28
29
30
31
32
33
34

35 **4.4. Conclusion**

36
37

38 Occupational therapy students develop discipline-specific skills and professional identities to
39 serve diverse communities. HEIs must address graduate attributes [41] and 21st-century skills [42]
40 in programme design. The i-DOT project exemplifies a flexible, collaborative model that advances
41 these objectives while preserving institutional autonomy.
42
43

44 Through technology, students accessed international experiences without financial or travel
45 barriers. The project enhanced diversity awareness and communication, core competencies in
46 occupational therapy [43]. Exposure to practice areas not available in students' home countries
47

55
56
57
58
59
60

1
2
3
4
5
6
7
8 contributed to professional identity formation and advocacy potential [44]. OTEs played a key
9
10 mentoring role in this process [45].

11
12 HEIs must consider how IaH benefits can be systematically integrated into existing curricula,
13 targeting both soft and occupational therapy-specific skills. As global crises increase the demand
14 for resilient occupational therapists, fostering international collaboration and professional
15 preparedness becomes increasingly critical.

International discussions in occupational therapy: Exploring facilitators and barriers to participation in a global collaborative learning experience

Focus group schedule: Students

Welcome and introduction

- A. Purpose of focus group
- B. Recording and confidentiality
- C. Discussion guidelines
- D. Commence with questions

1. Describe your experience of the i-DOT project.

- What were your expectations before the project started and how were these expectations met?

- What were your feelings regarding the project before, during and after the project?

2. What do you think your institution wanted you to learn during the i-DOT project?

- Do you think that the i-DOT project allowed you to achieve this?

3. Talk about how the i-DOT project has or has not benefited your knowledge or insight about occupational therapy, the elderly or the effects of COVID-19 on occupation.

- How did it improve your knowledge or insight?

4. What skills, if any, did you or your peers develop in this process that can assist you in your academic and professional OT career?

5. How did the experience of the i-DOT project affect or benefit you on a personal level?

- What social benefits, if any, did the project have?

6. Describe your experience of interacting with someone from a different cultural background.

- Did the i-DOT project provide enough opportunity to increase your awareness of diversity?

7. What sort of challenges did you experience during this project?

- Talk about how you managed the obstacles or challenges you were faced with..

8 8. Given that i-DOT is not a completely structured project, where students from the various
9 universities have different learning goals and are from different years of study, what are your
10 thoughts around the sustainability of projects like this?

11 9. Do you have recommendations for future projects like this?
12 • What should change and what should stay the same?

International discussions in occupational therapy: Exploring facilitators and barriers to participation in a global collaborative learning experience

Focus group schedule: Staff / Academics

- A. Welcome and introduction
- B. Purpose of focus group
- C. Recording and confidentiality
- D. Discussion guidelines
- E. Commence with questions

- 1. Describe the overall experience of i-DOT for your students from your perspective as an academic involved in the project.
 - How would you describe your students' experience of the project?
 - Would you say that their overall experience was generally positive, negative or neutral and why?
- 2. What are some of the formal learning outcomes that your institute had for students during the i-DOT project?
 - Please elaborate on whether or not you think the students achieved the learning outcomes that were hoped for.
- 3. What are some of the informal learning outcomes that your institute had for students during the i-DOT project?
 - Please elaborate on whether or not you think the students achieved the learning outcomes that were hoped for.
- 4. Aside from academic learning, do you think that the i-DOT project offered any other benefits to students professionally?
 - Professional benefits could include general or soft skills needed in any work setting. Are there transferable skills like these that the students had the opportunity to develop?
- 5. From your perspective, do you think that students had the opportunity to experience personal growth during this project?
 - Personal growth may mean...
- 6. From your perspective, do you think that students had the opportunity to experience social growth during this project?

9
10 • Social growth may mean...

11 7. Discuss whether you think students developed a greater awareness of diversity and
12 culture during this project, and how it may impact on occupation.

13 • Diversity here means
14 • Culture here means

15 8. What aspects of the planning and execution of the i-DOT project worked particularly
16 well?

17 9. What challenges did you or your students experience during the i-DOT project?

18 10. i-DOT is not a completely structured project in that institutions are able to decide
19 whether student participation is compulsory or voluntary, and graded or ungraded. What are
20 your thoughts around the sustainability of projects like this?

21 11. Do you have recommendations for future projects of this nature?

22 • What should change and what should stay the same?
