Read me file:

University of Southampton – ECS – Domenico Balsamo – db2a12@soton.ac.uk

The excel file contains experimental data for the paper. In particular:

Fig. 1. Example outputs from energy harvesters: voltage of a wind harvester over one 'gust', and current from an indoor photovoltaic module over a day.

Fig. 2. Operation of a transiently-powered system.

Fig. 7. Calculated voltage drop (Vcal - Vmeas) with different Vcal.

Fig. 10. Current consumption during execution of FFT algorithm at 2.5V.

Fig. 16. Comparison of Hibernus++ with Mementos and QuickRecall, showing performance when executing an FFT (averaged over 3 executions): (a) number of checkpoints made, (b) number of snapshots saved, (c) number of snapshots restored, (d) energy overhead.

Fig. 19. Energy overhead comparison between Hibernus++ and QuickRecall.

Date of data collection: from February 2014 - February 2016

Information about geographic location of data collection: University of Southampton, U.K.

Date that the file was created: March 2016
